# DART\_LAB Tutorial Section 2: How Should Observations Impact an Unobserved State Variable? Multivariate Assimilation.

# Single observed variable, single unobserved variable.

So far, we have a known likelihood for a single variable.

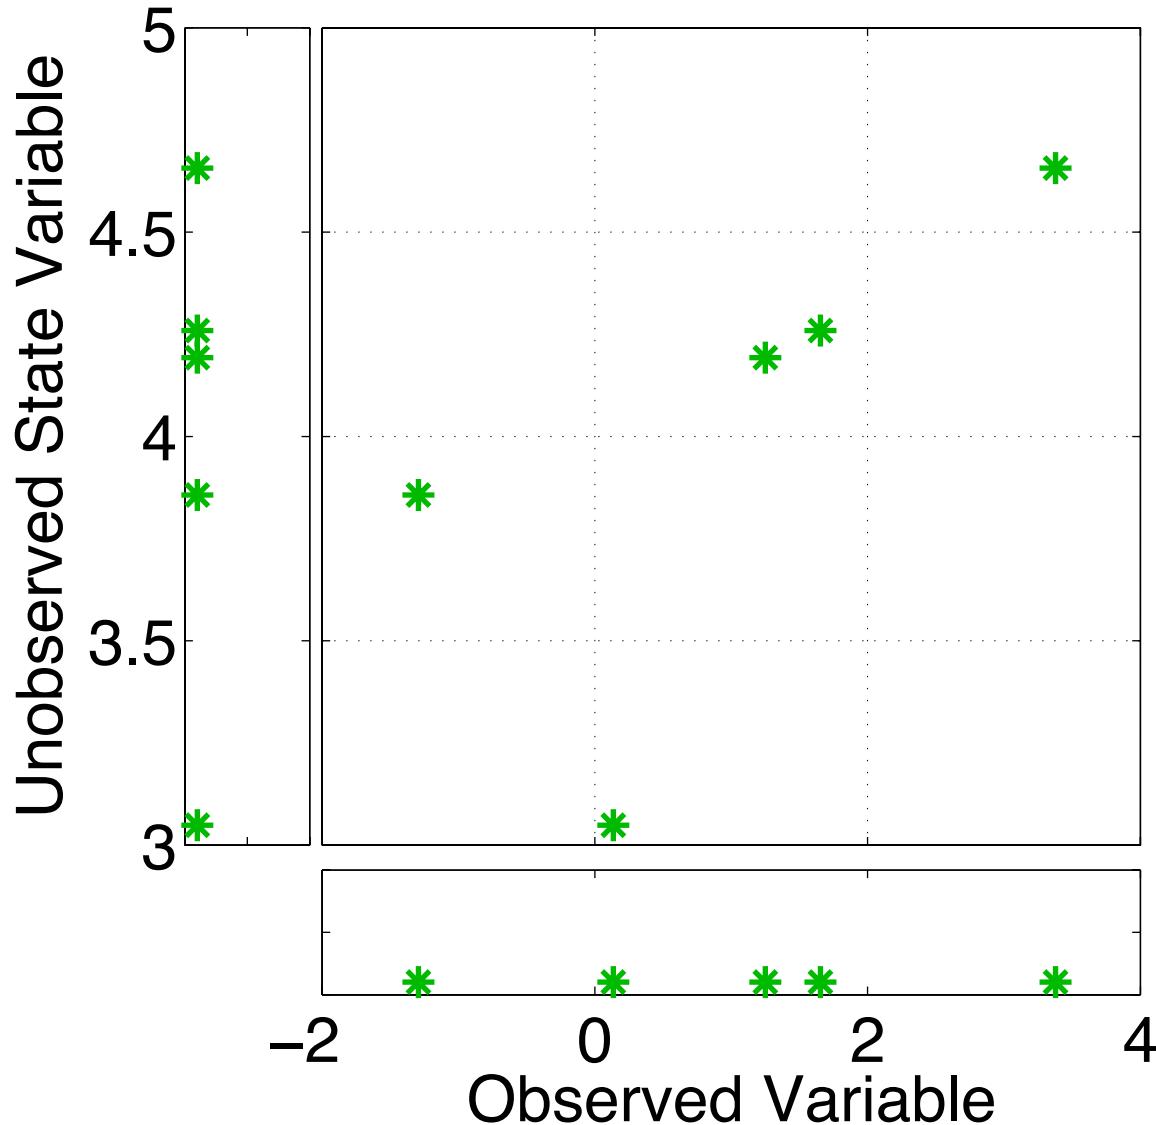

Now, suppose the prior has an additional unobserved variable ...

We will examine how ensemble members update the additional variable.

Basic method generalizes to any number of additional variables.

# Ensemble filters: Updating additional prior state variables

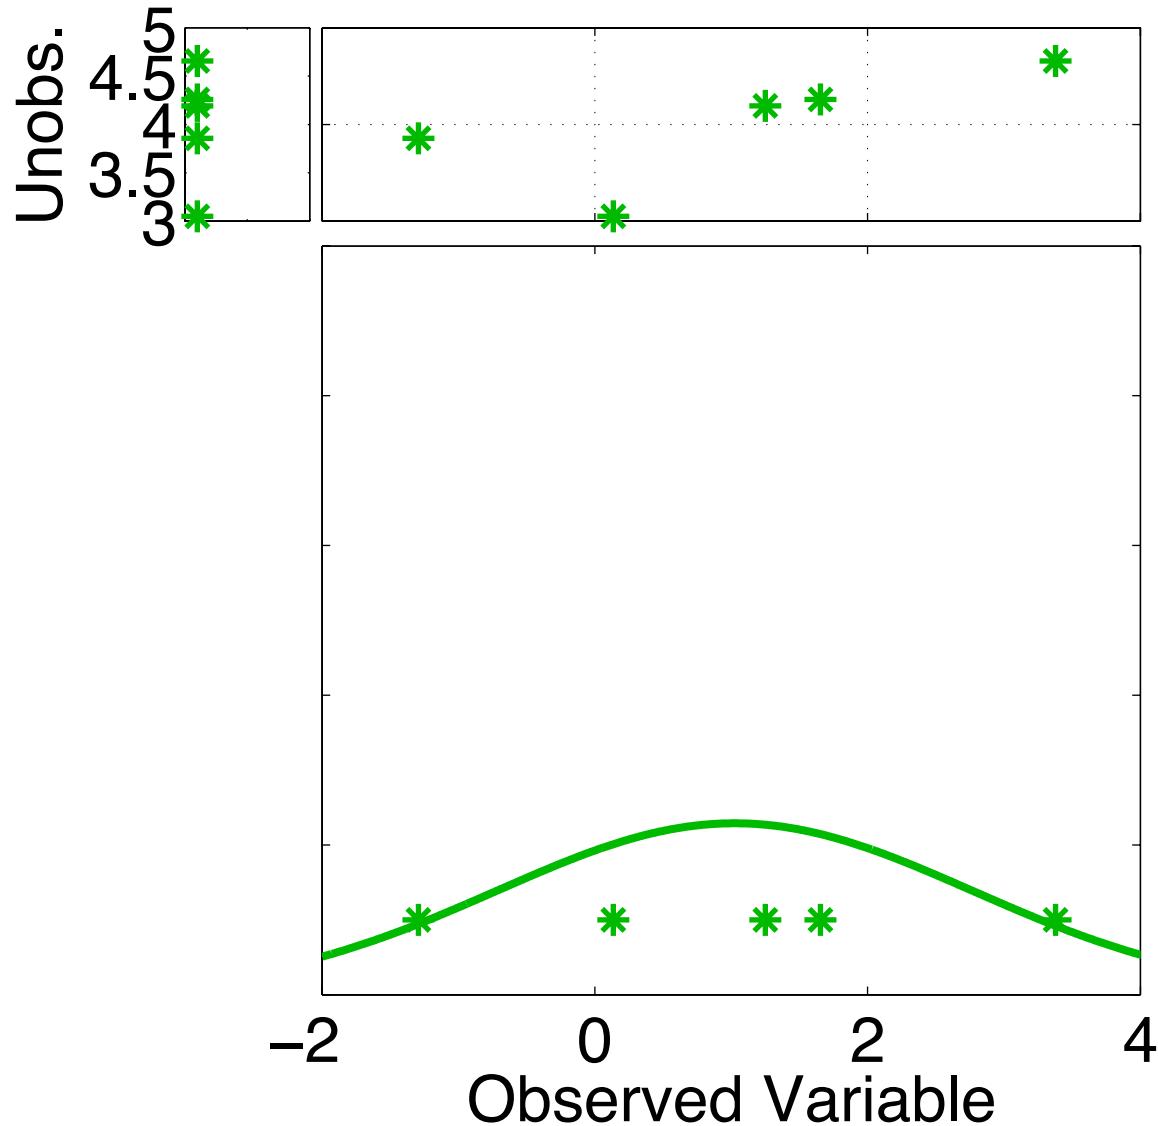

Assume that all we know is the prior joint distribution.

One variable is observed.

What should happen to the unobserved variable?

# Ensemble filters: Updating additional prior state variables

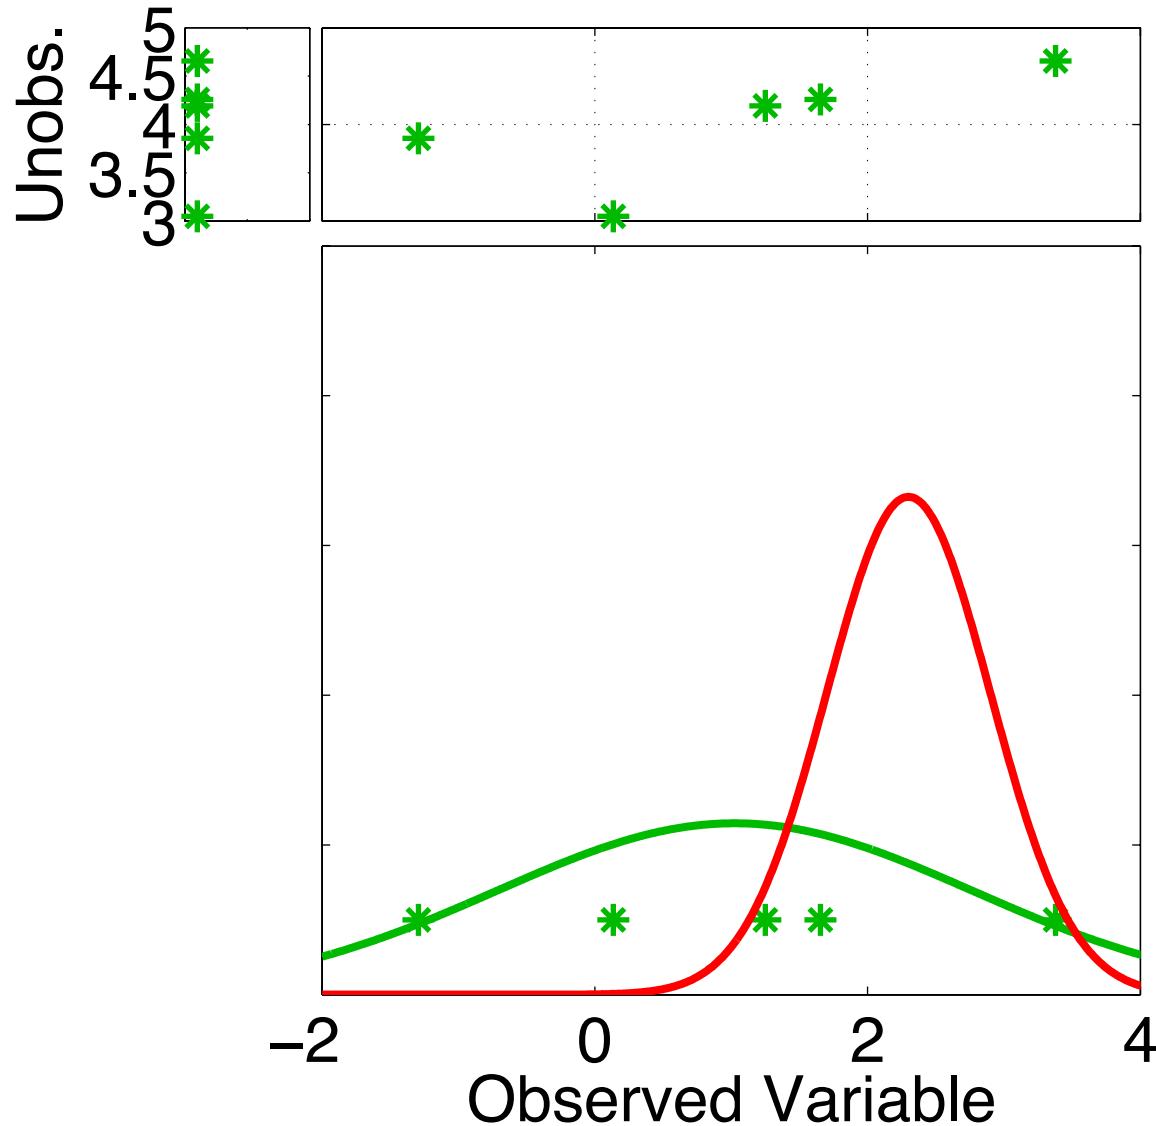

Assume that all we know is the prior joint distribution.

One variable is observed.

Update observed variable as in section 1.

# Ensemble filters: Updating additional prior state variables

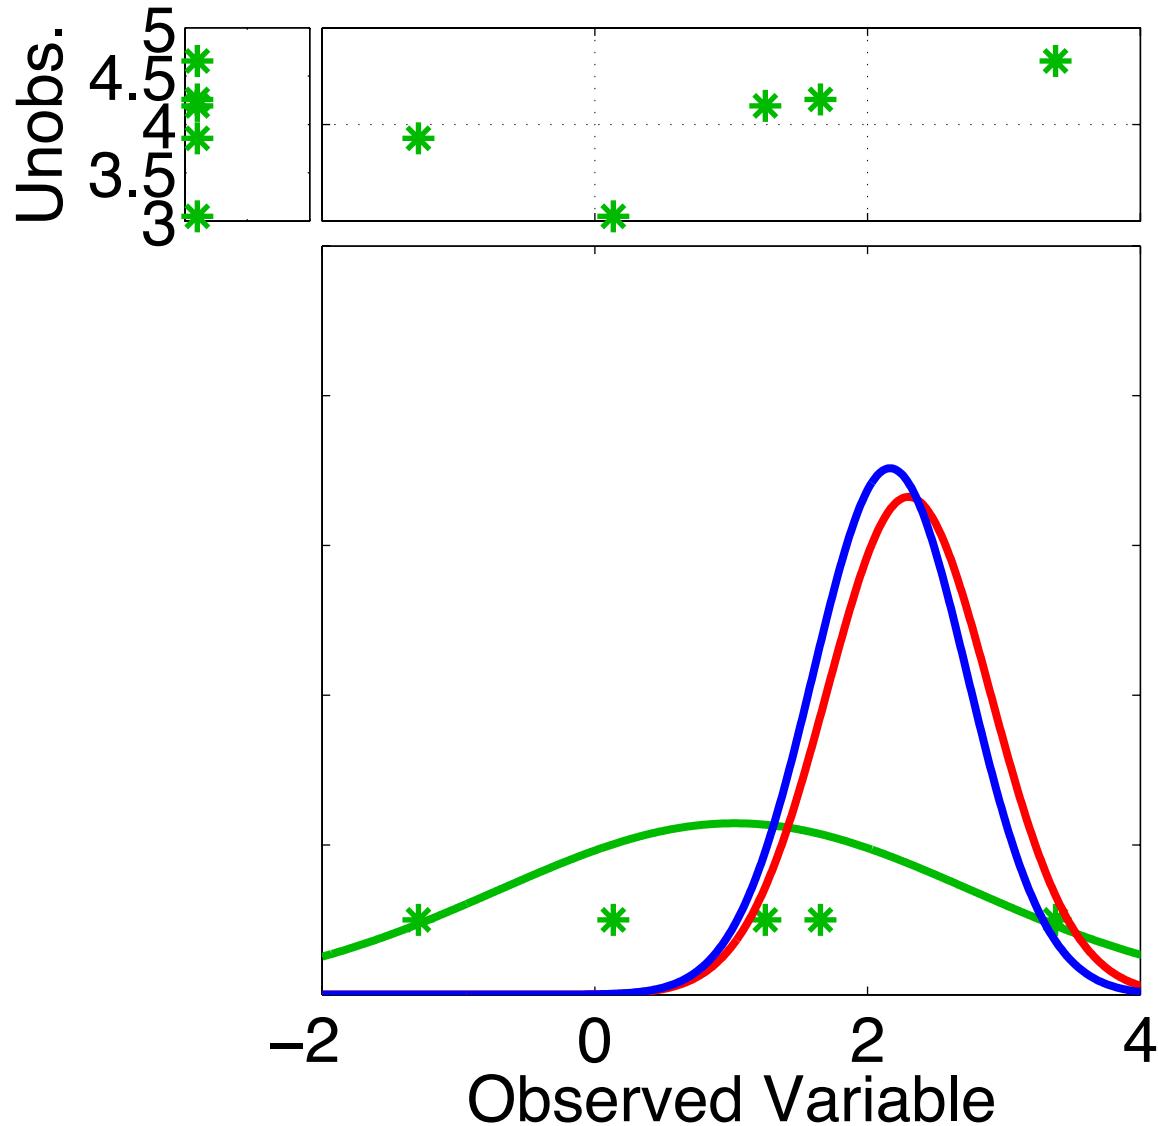

Assume that all we know is the prior joint distribution.

One variable is observed.

Update observed variable as in section 1.

# Ensemble filters: Updating additional prior state variables

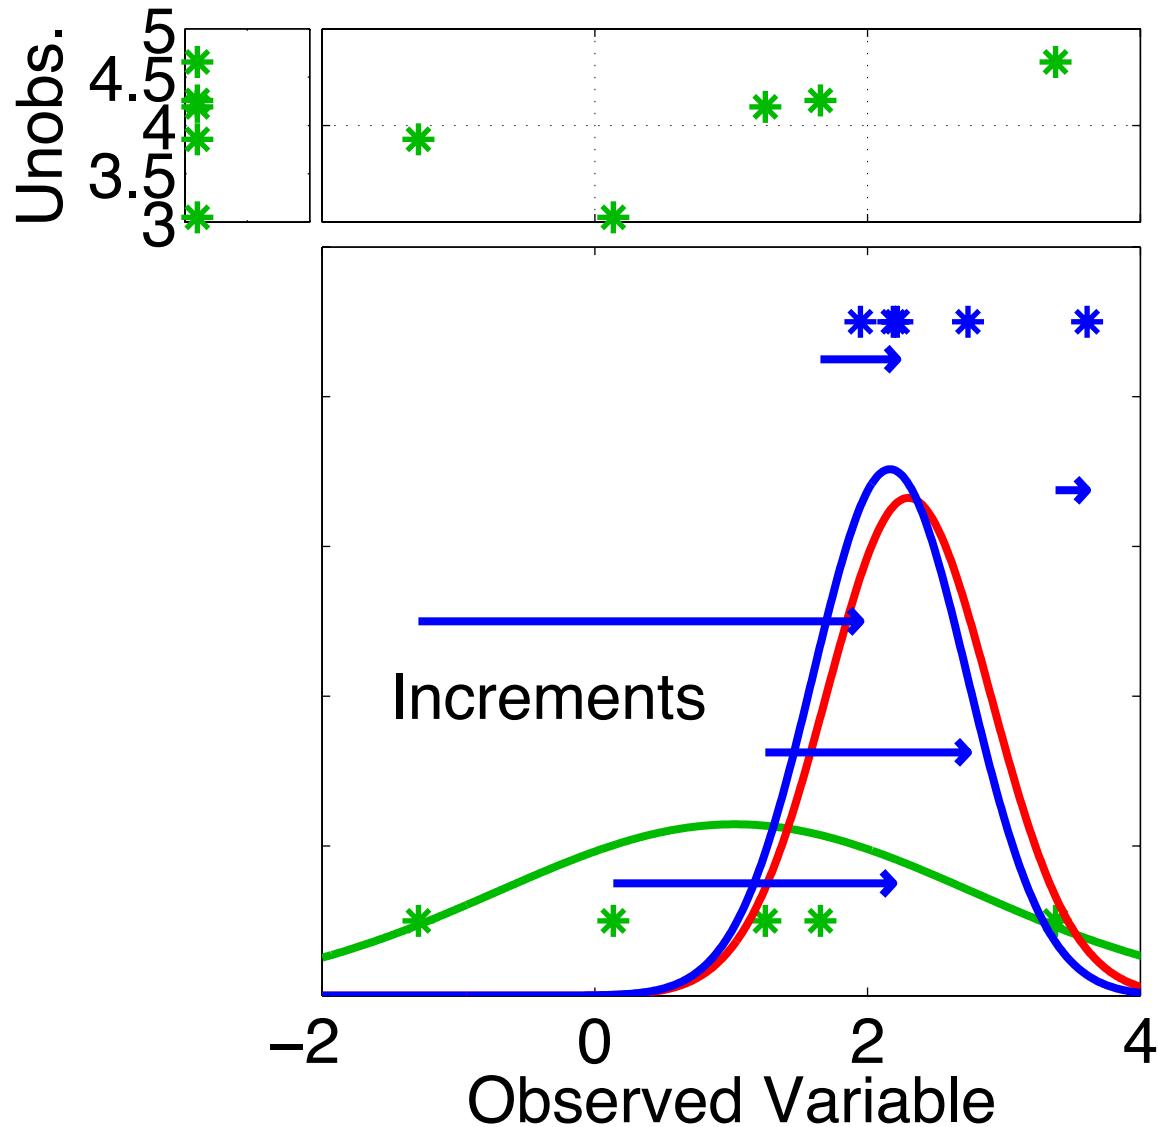

Assume that all we know is the prior joint distribution.

One variable is observed.

Update observed variable as in section 1.

# Ensemble filters: Updating additional prior state variables

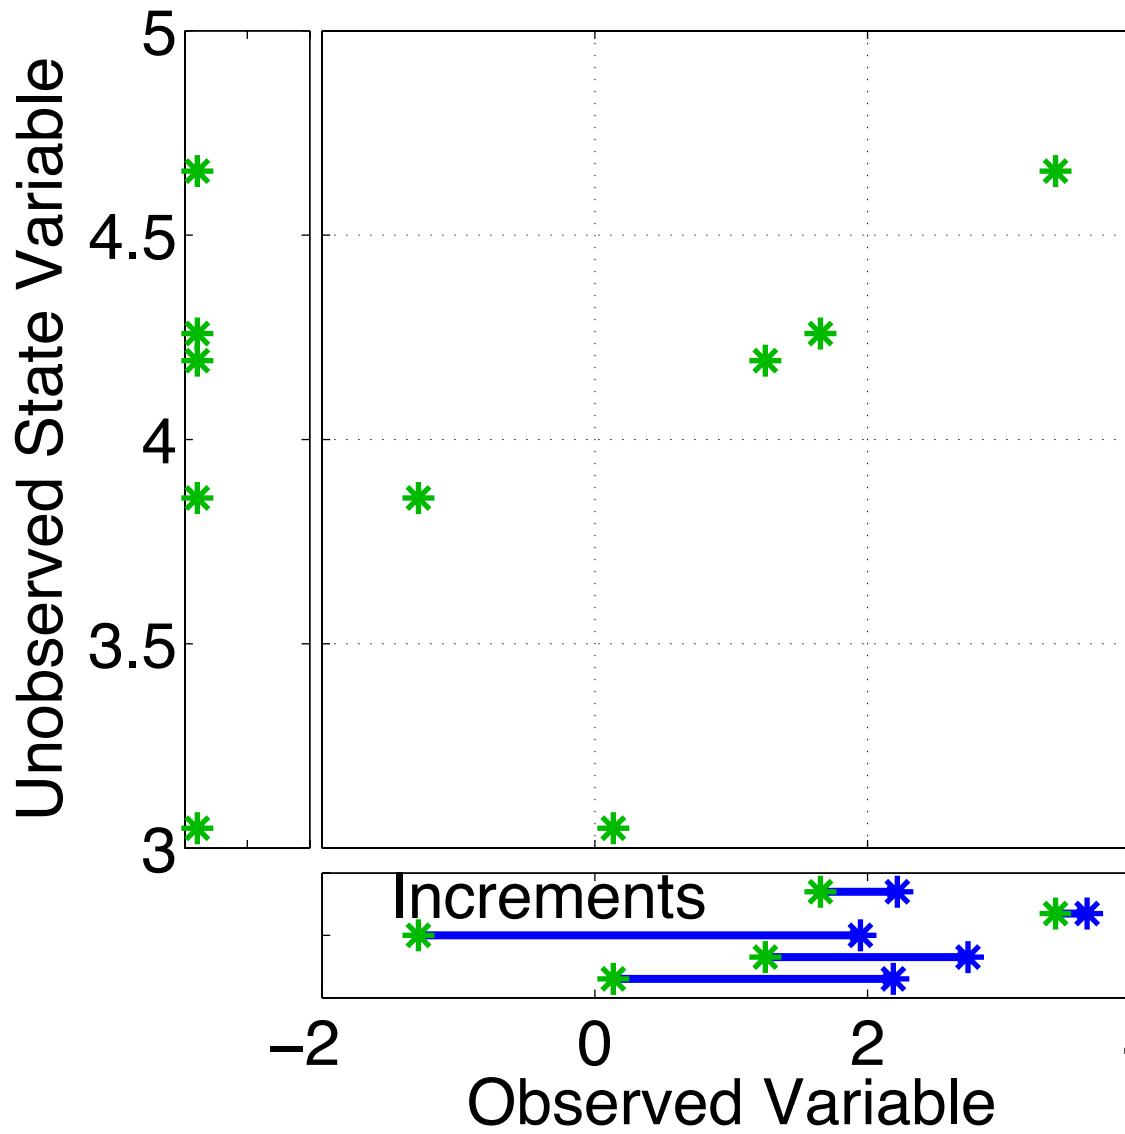

Assume that all we know is the prior joint distribution.

One variable is observed.

Compute increments for prior ensemble members of observed variable.

# Ensemble filters: Updating additional prior state variables

Assume that all we know is the prior joint distribution.

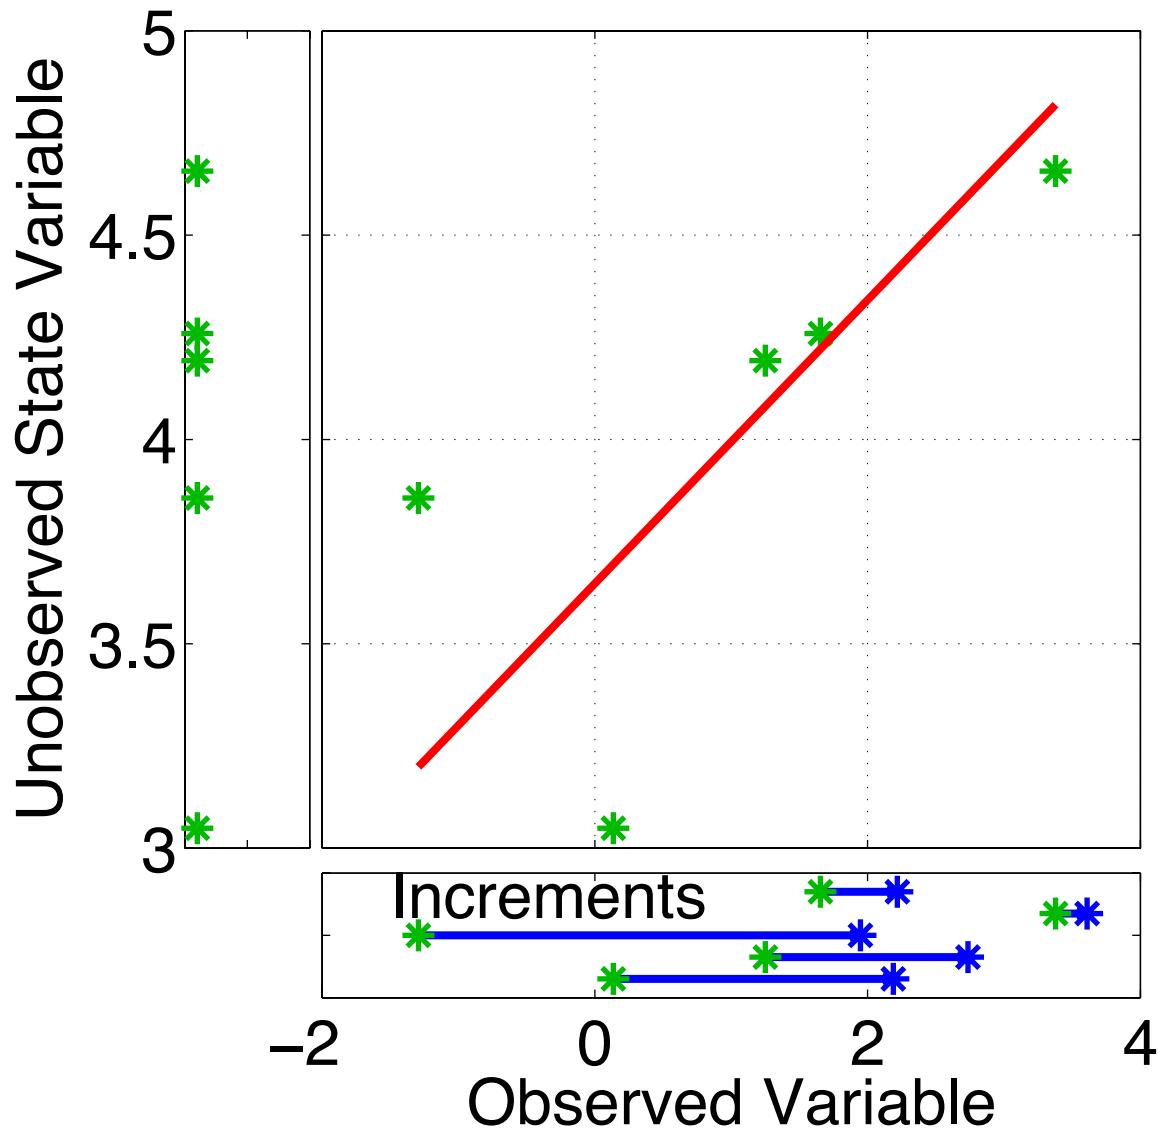

How should the unobserved variable be impacted?

1<sup>st</sup> choice: least squares.

Equivalent to linear regression.

Same as assuming binormal prior.

# Ensemble filters: Updating additional prior state variables

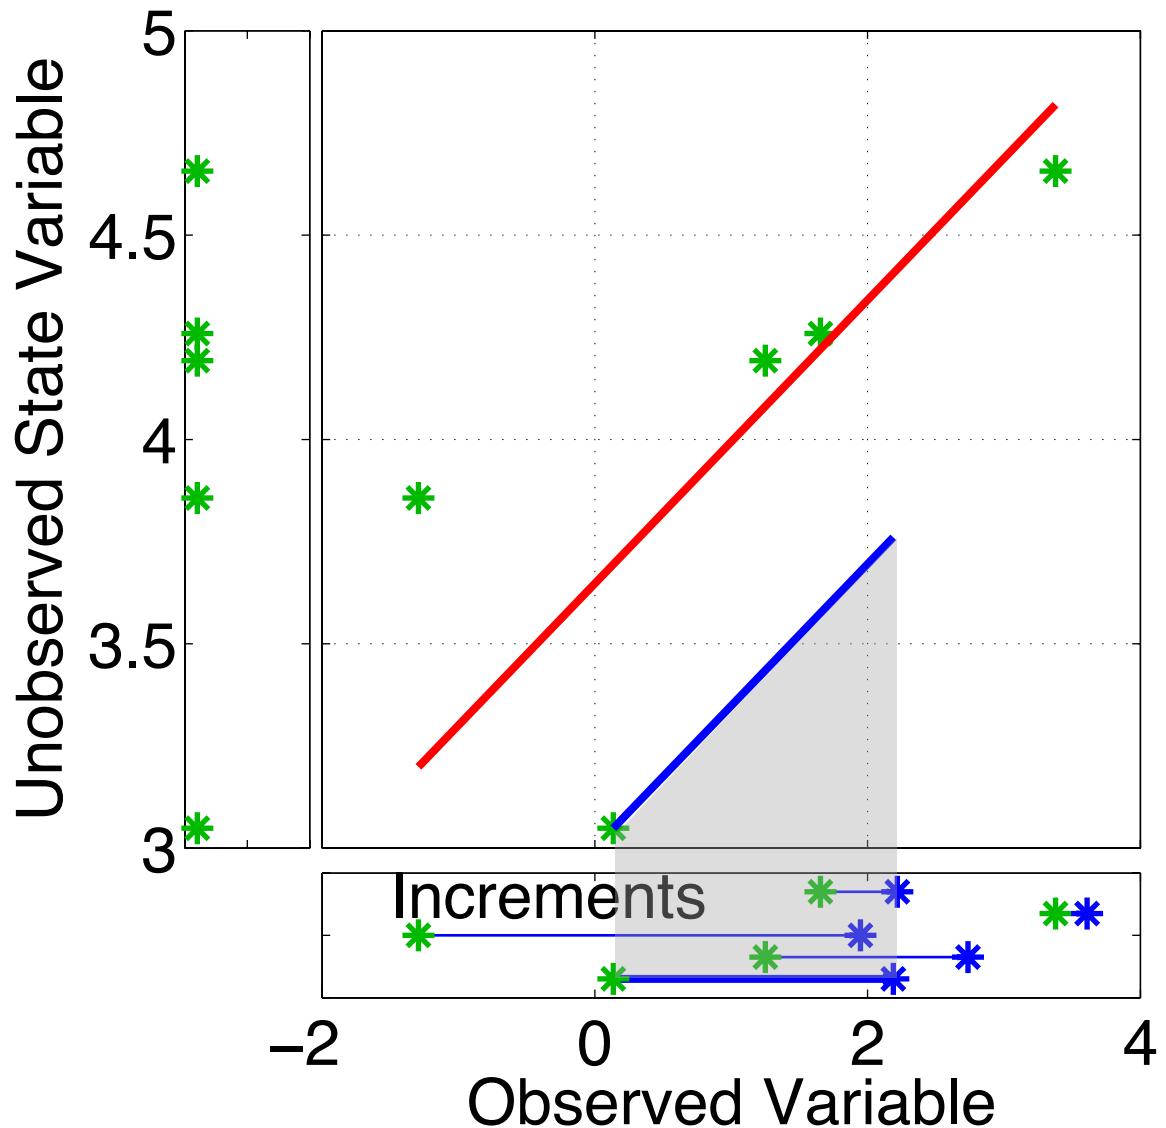

Have joint prior distribution of two variables.

How should the unobserved variable be impacted?

1<sup>st</sup> choice: least squares.

Begin by finding **least squares fit**.

# Ensemble filters: Updating additional prior state variables

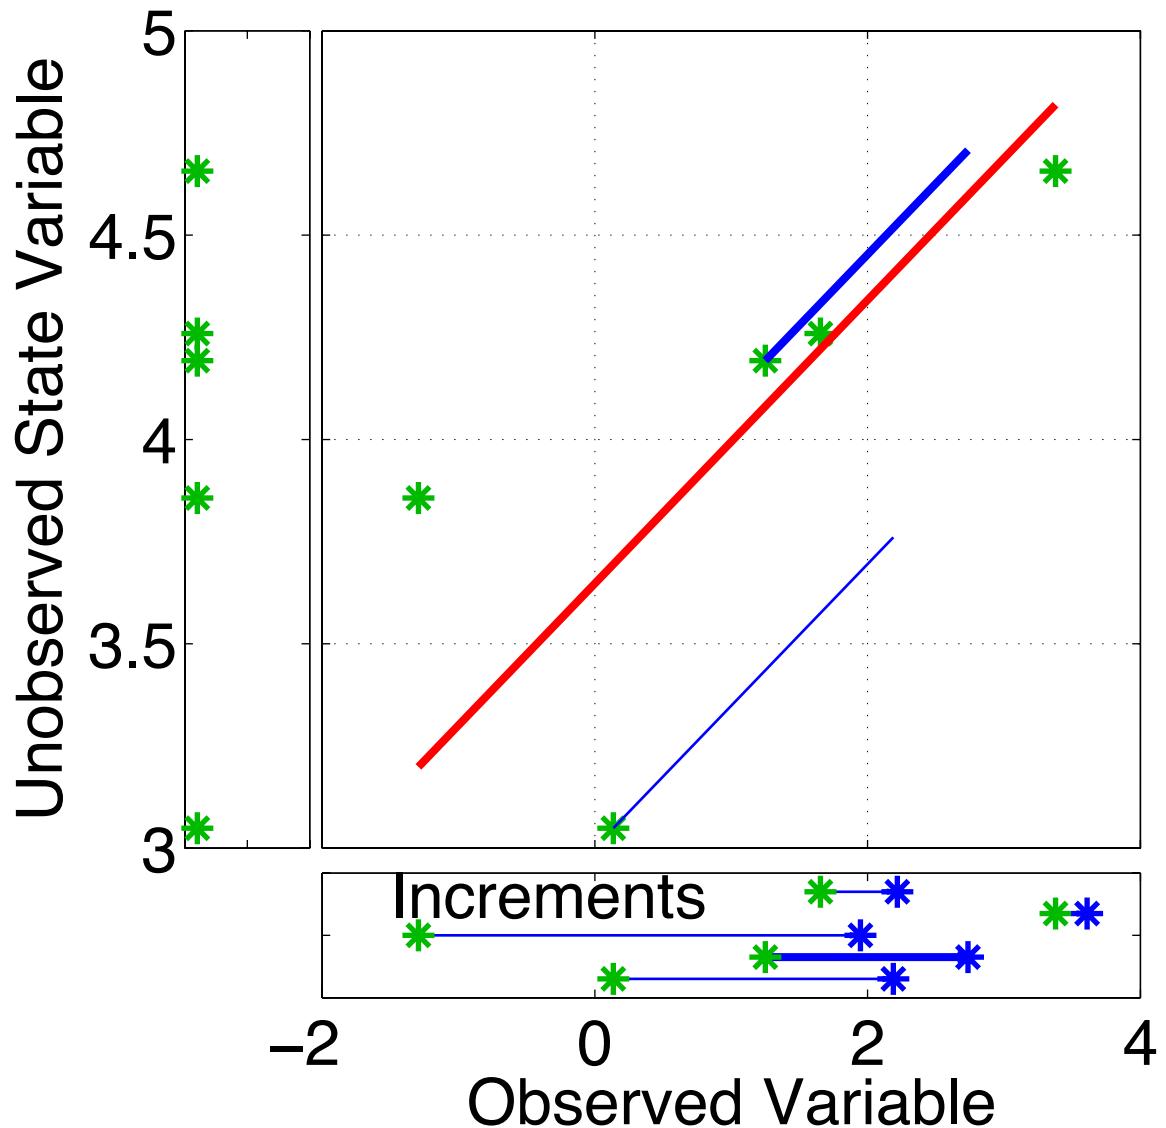

Have joint prior distribution of two variables.

Next, regress the observed variable increments onto increments for the unobserved variable.

Equivalent to first finding image of increment in bivariate space.

# Ensemble filters: Updating additional prior state variables

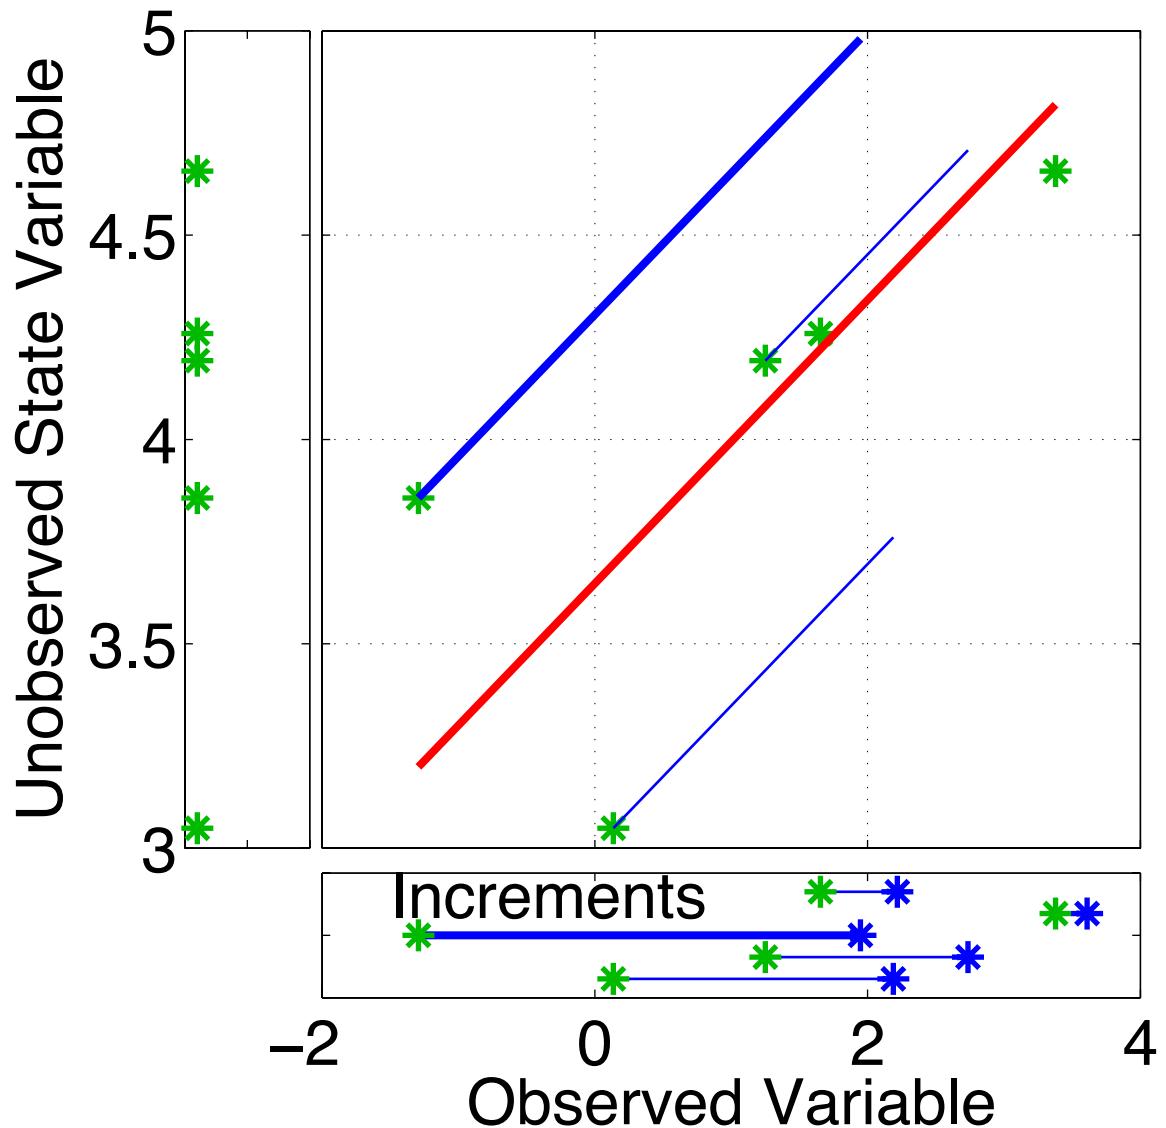

Have joint prior distribution of two variables.

Next, regress the observed variable increments onto increments for the unobserved variable.

Equivalent to first finding image of increment in bivariate space.

# Ensemble filters: Updating additional prior state variables

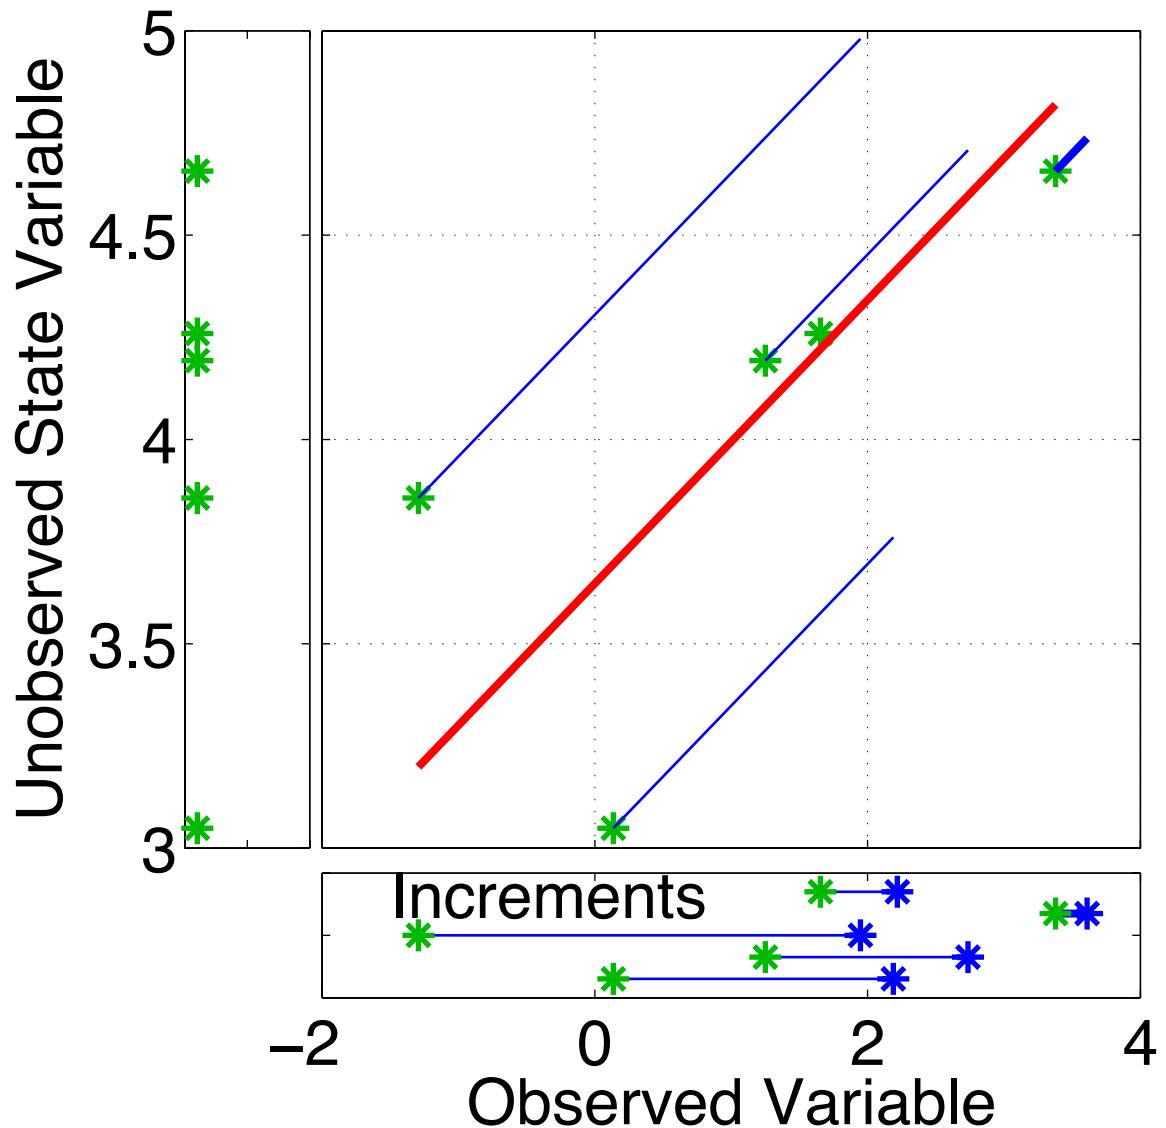

Have joint prior distribution of two variables.

Next, regress the observed variable increments onto increments for the unobserved variable.

Equivalent to first finding image of increment in bivariate space.

# Ensemble filters: Updating additional prior state variables

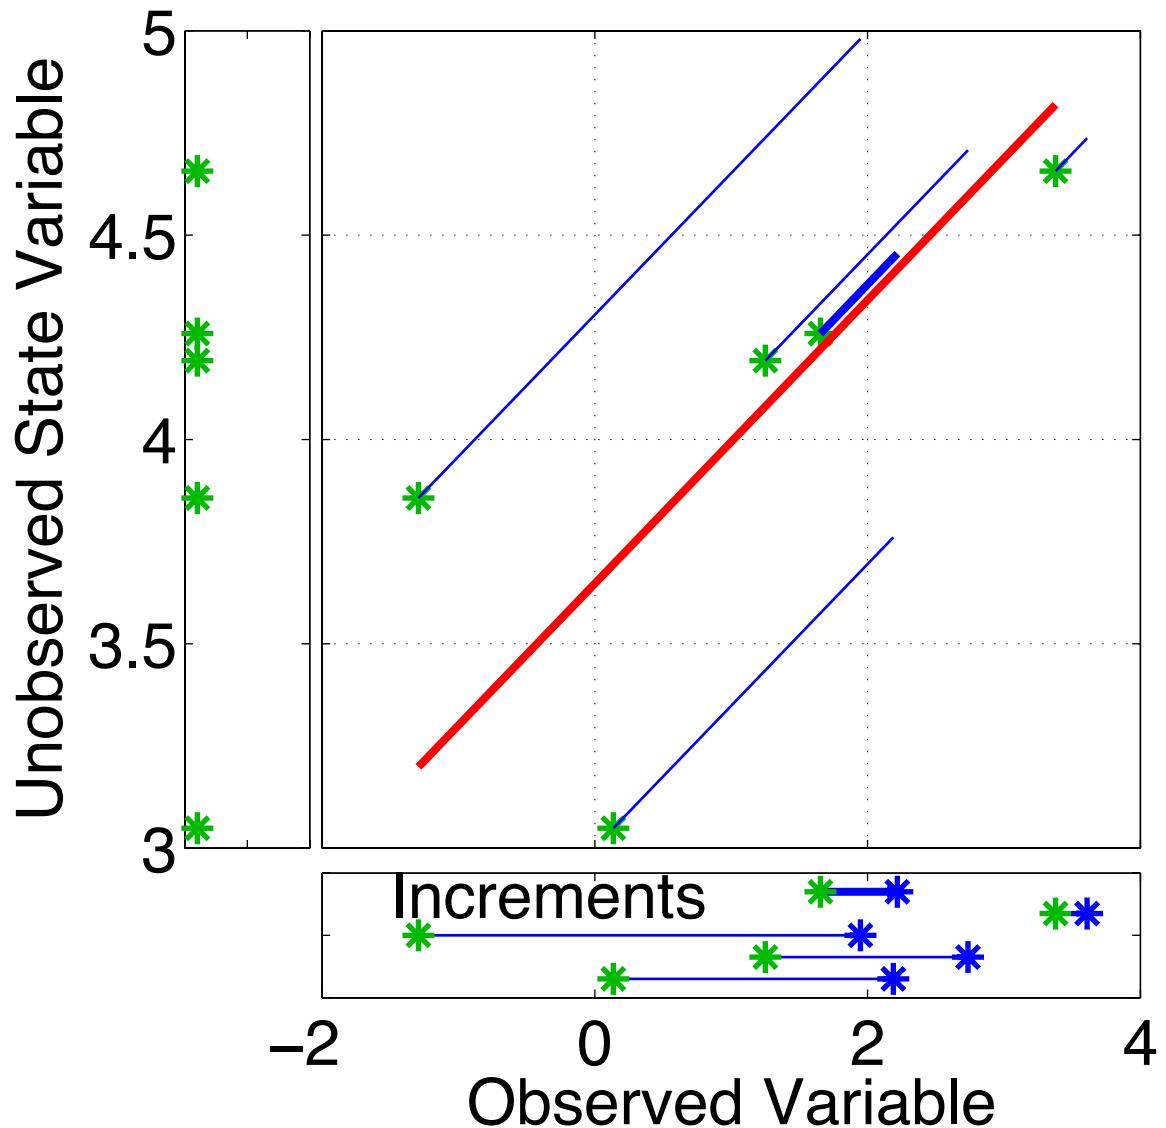

Have joint prior distribution of two variables.

Next, regress the observed variable increments onto increments for the unobserved variable.

Equivalent to first finding image of increment in bivariate space.

# Ensemble filters: Updating additional prior state variables

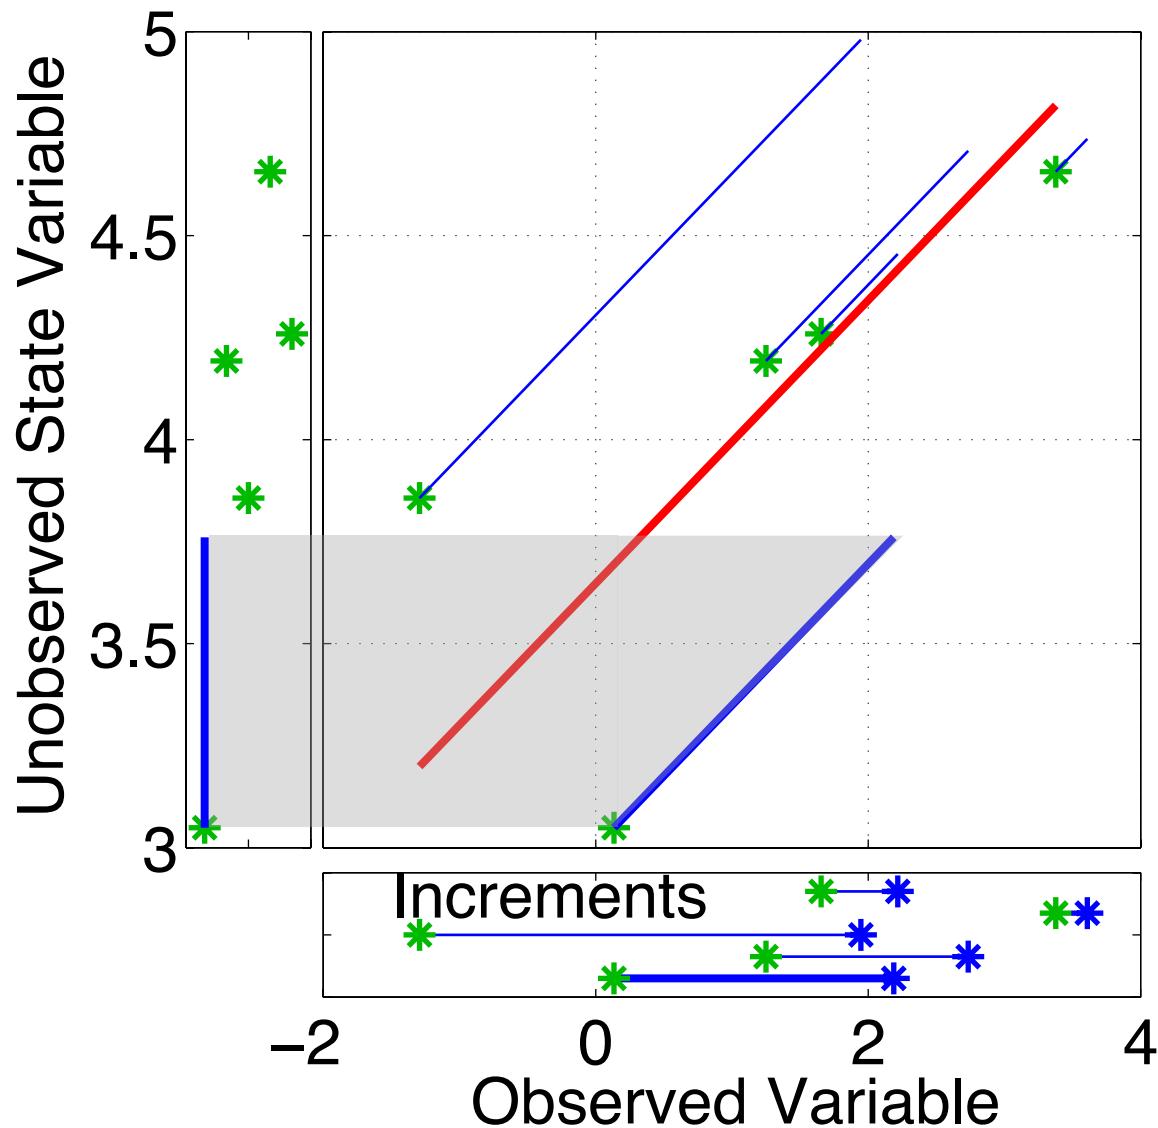

Have joint prior distribution of two variables.

Next, regress the observed variable increments onto increments for the unobserved variable.

Equivalent to first finding image of increment in bivariate space.

# Ensemble filters: Updating additional prior state variables

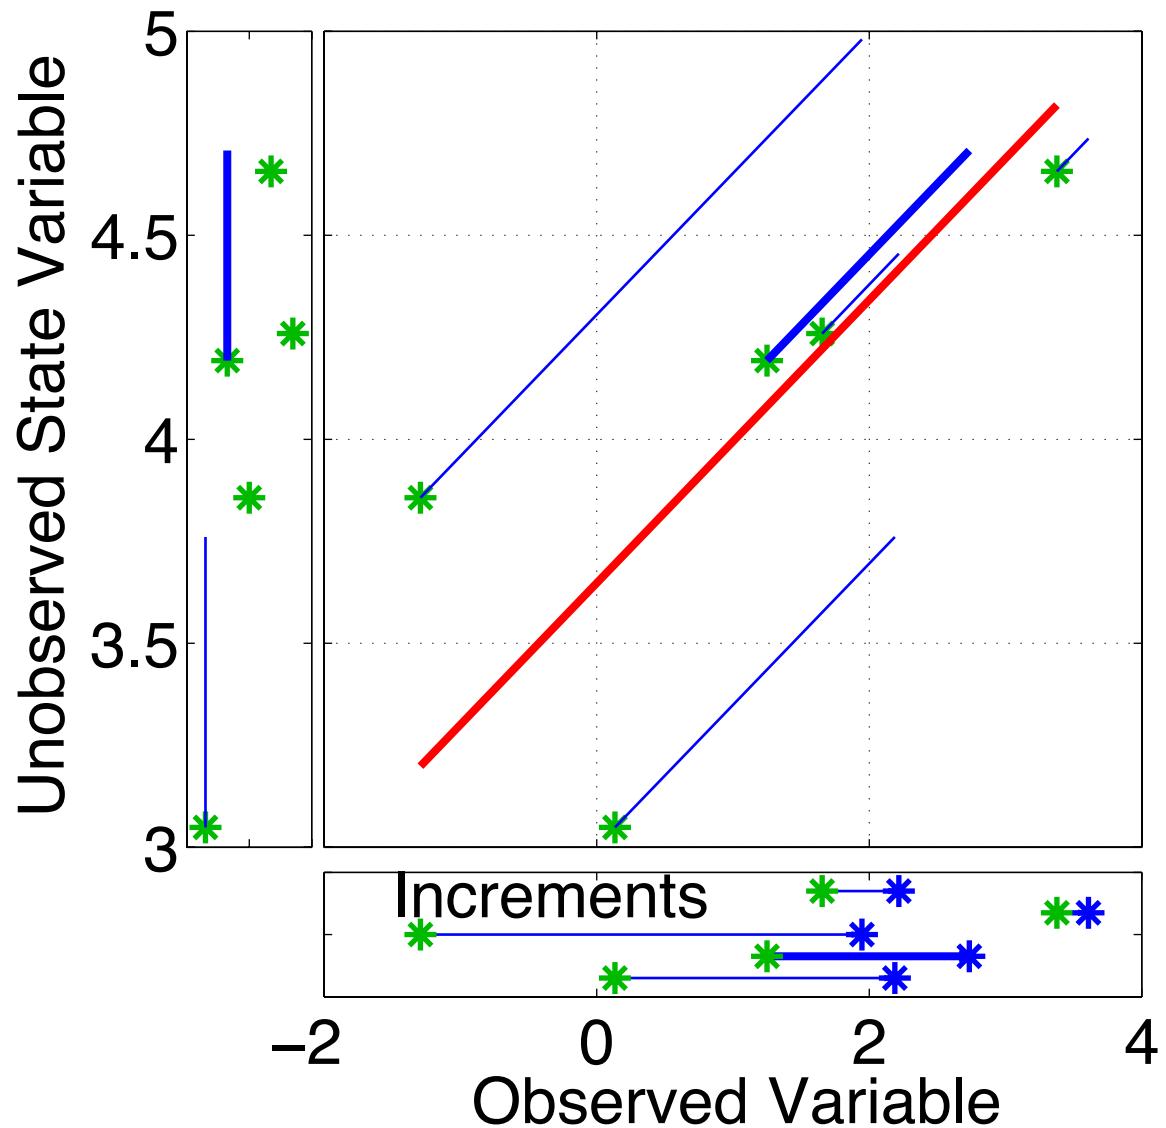

Have joint prior distribution of two variables.

Regression: Equivalent to first finding image of increment in bivariate space.

Then projecting from bivariate space onto unobserved priors.

# Ensemble filters: Updating additional prior state variables

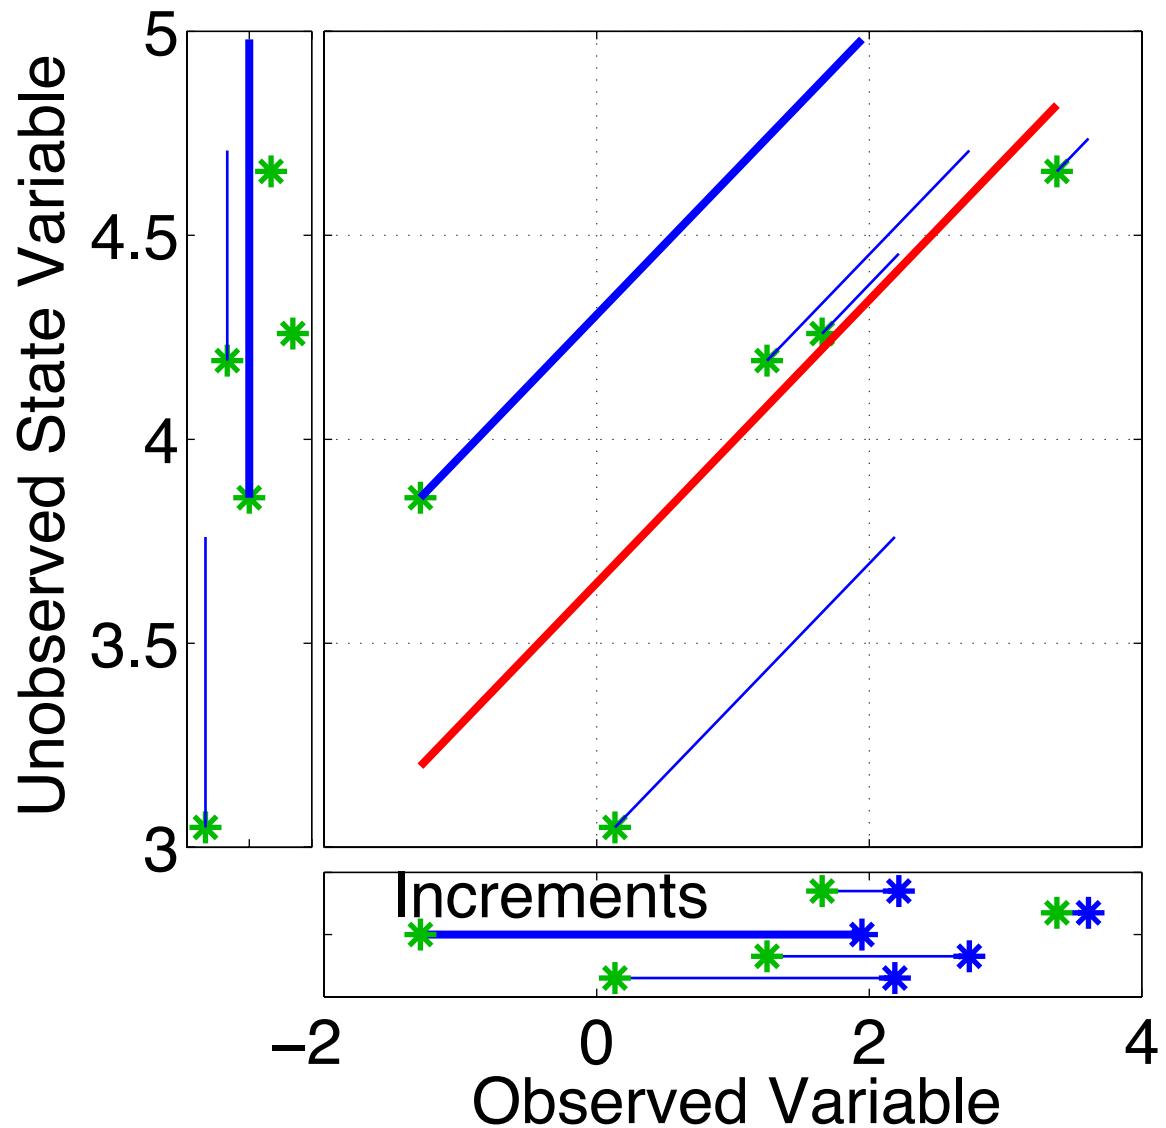

Have joint prior distribution of two variables.

Regression: Equivalent to first finding image of increment in bivariate space.

Then projecting from bivariate space onto unobserved priors.

# Ensemble filters: Updating additional prior state variables

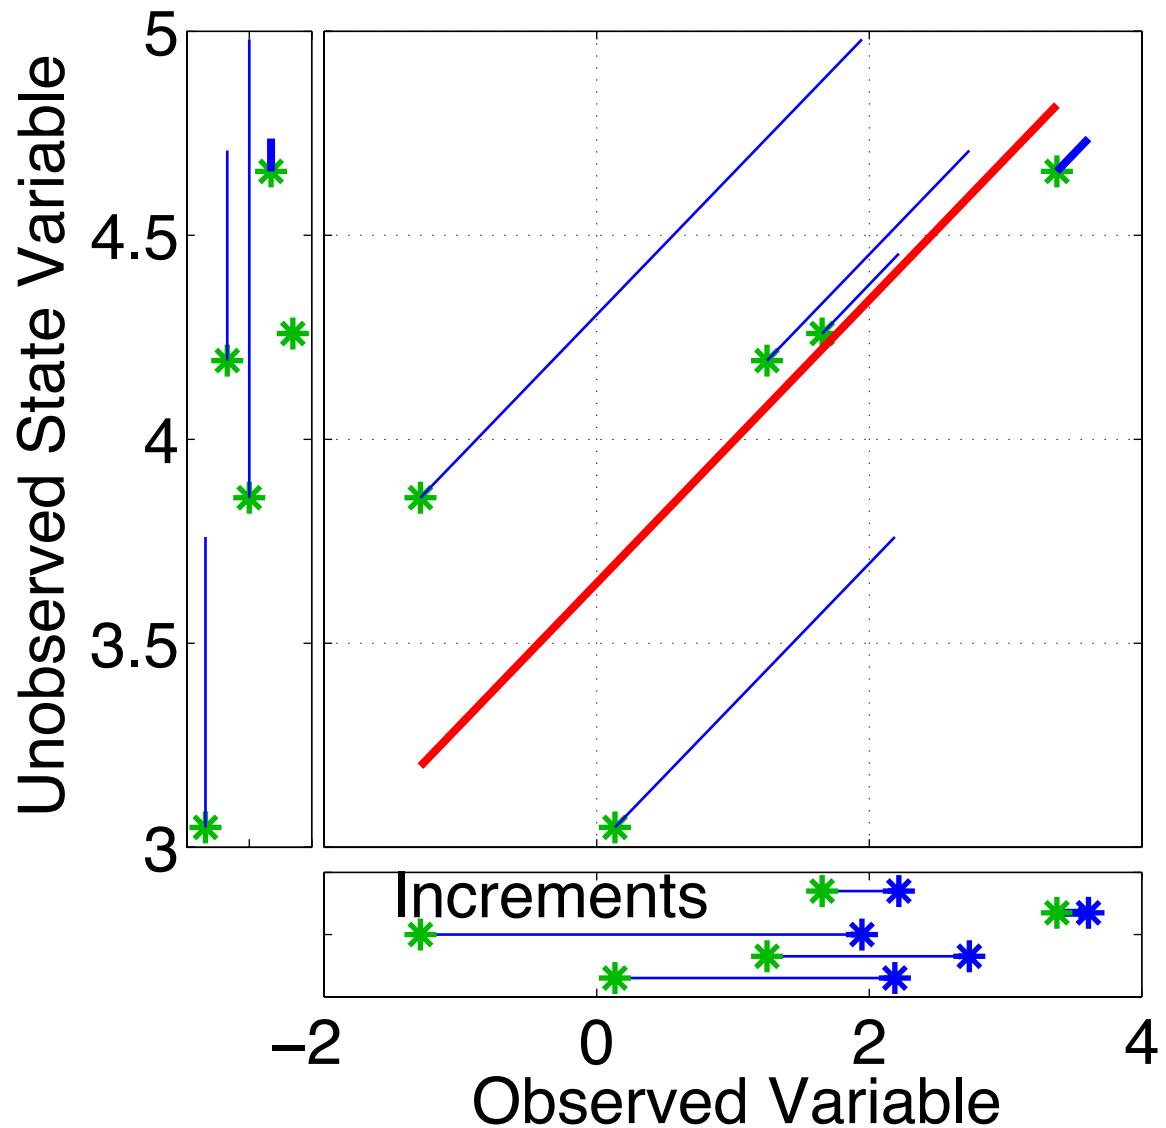

Have joint prior distribution of two variables.

Regression: Equivalent to first finding image of increment in bivariate space.

Then projecting from bivariate space onto unobserved priors.

# Ensemble filters: Updating additional prior state variables

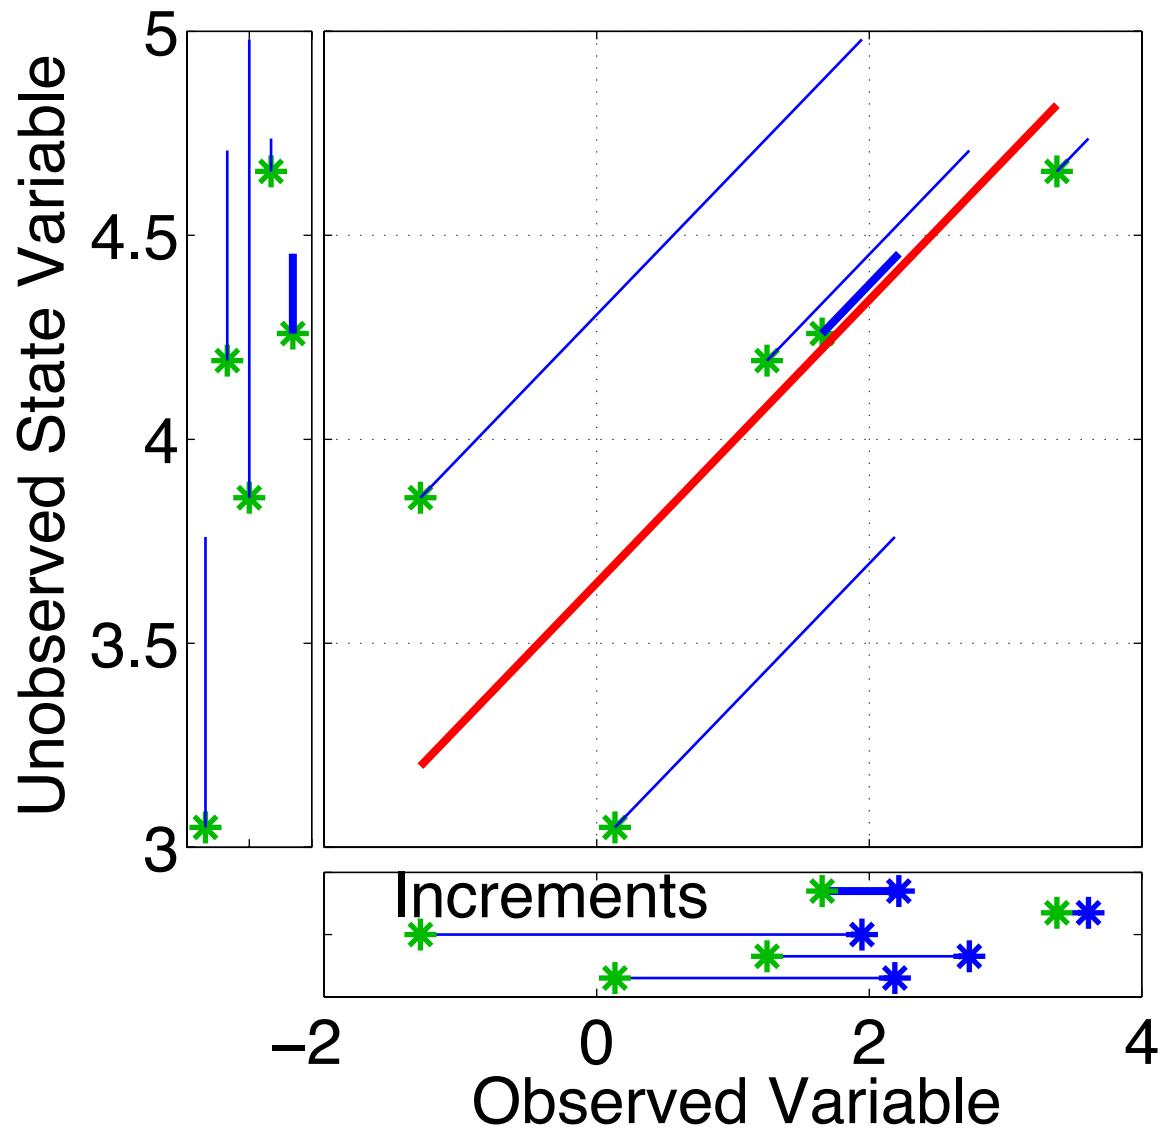

Have joint prior distribution of two variables.

Regression: Equivalent to first finding image of increment in bivariate space.

Then projecting from bivariate space onto unobserved priors.

# Ensemble filters: Updating additional prior state variables

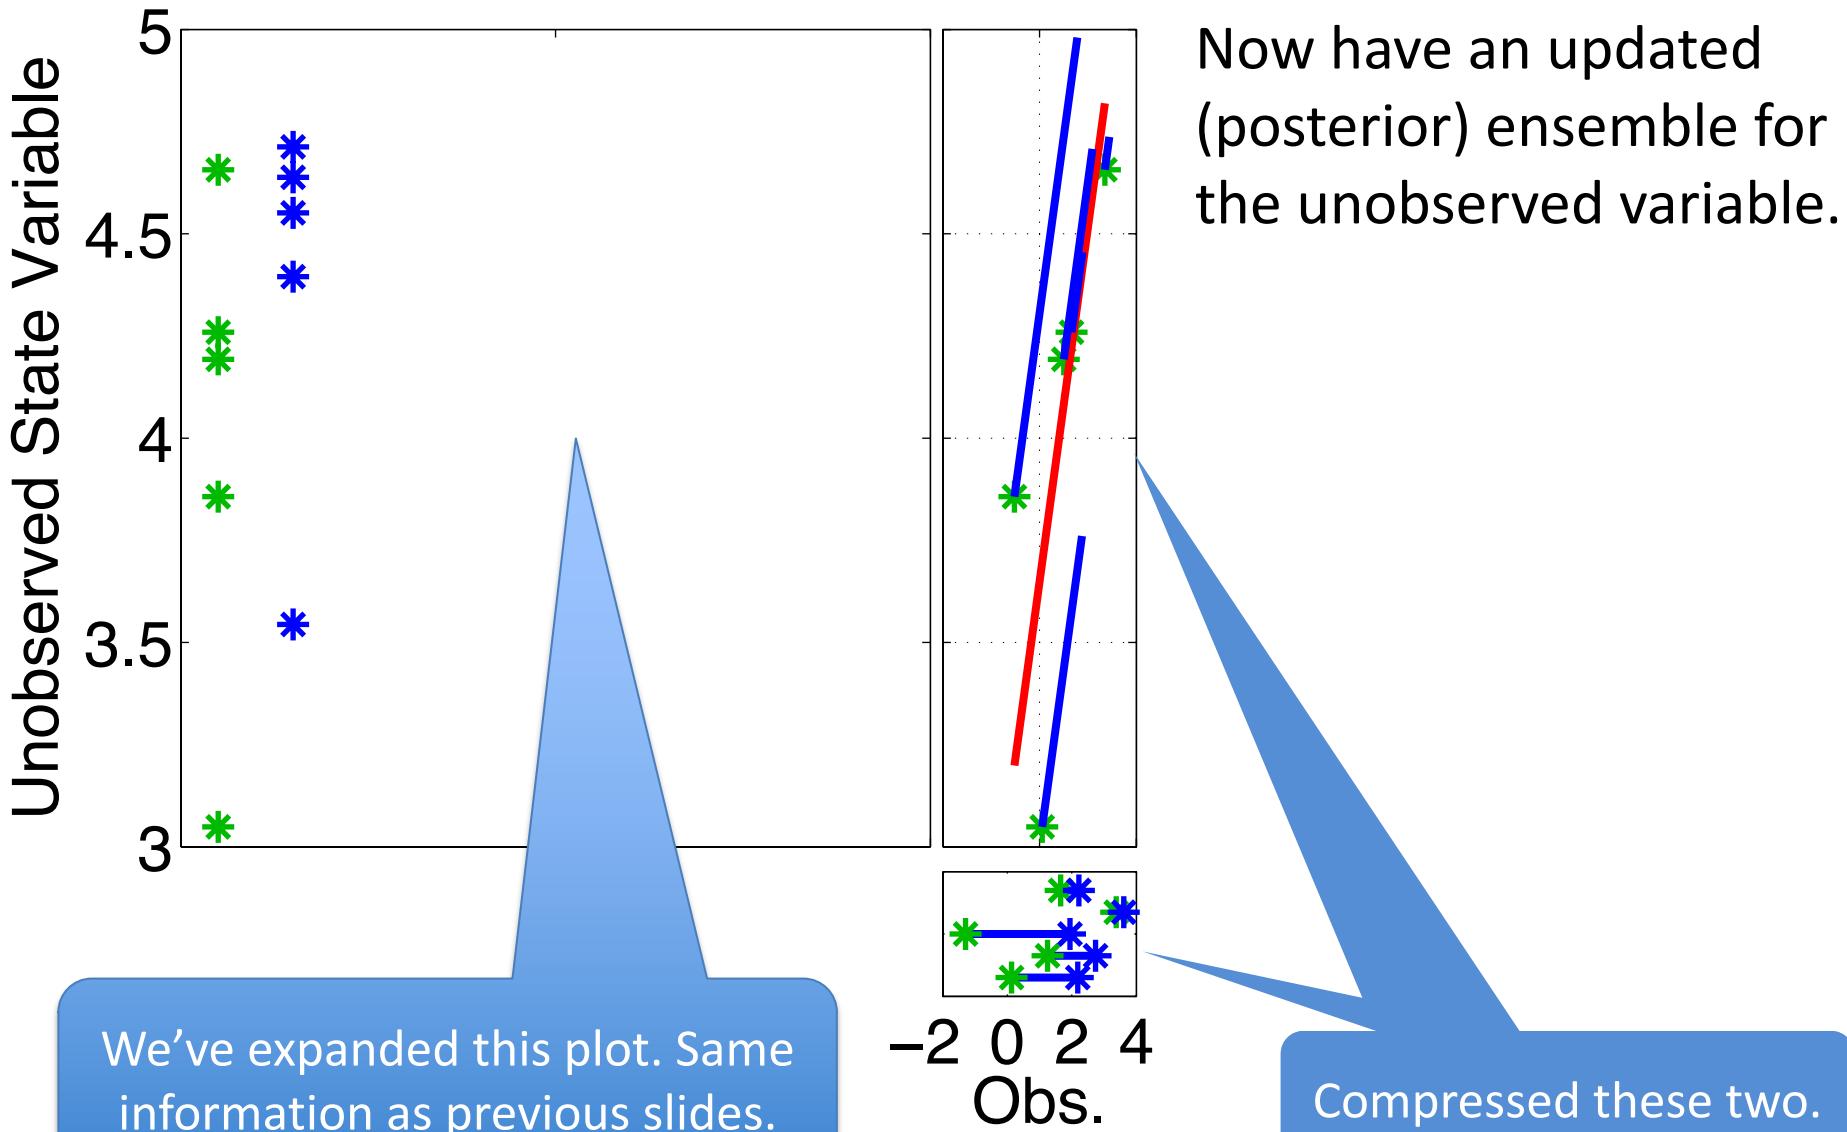

Have joint prior distribution of two variables.

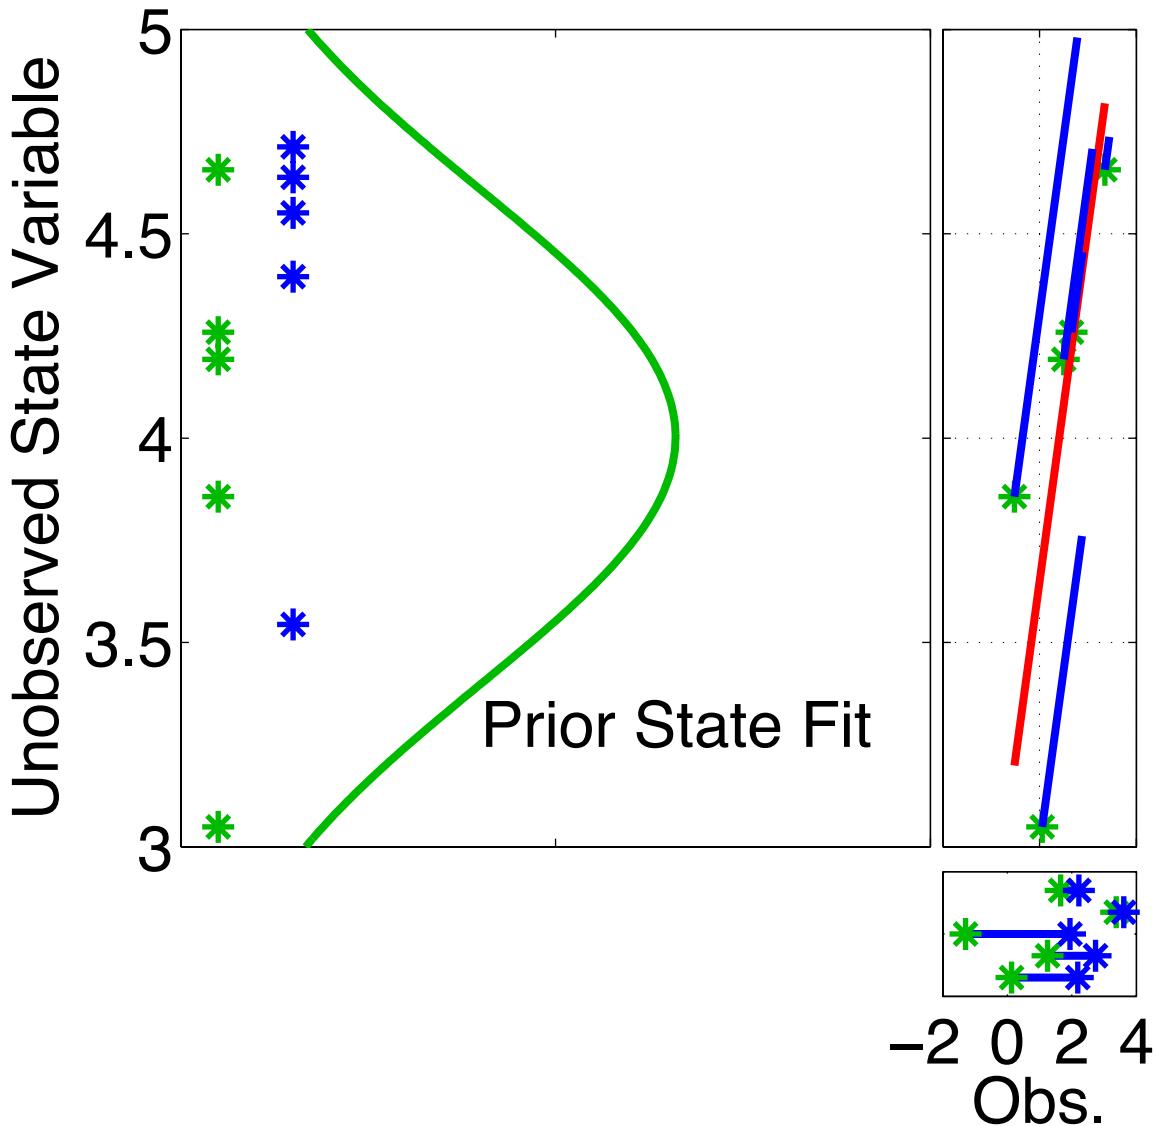

Regression: Equivalent to first finding image of increment in bivariate space.

Then projecting from bivariate space onto unobserved priors.

# Ensemble filters: Updating additional prior state variables

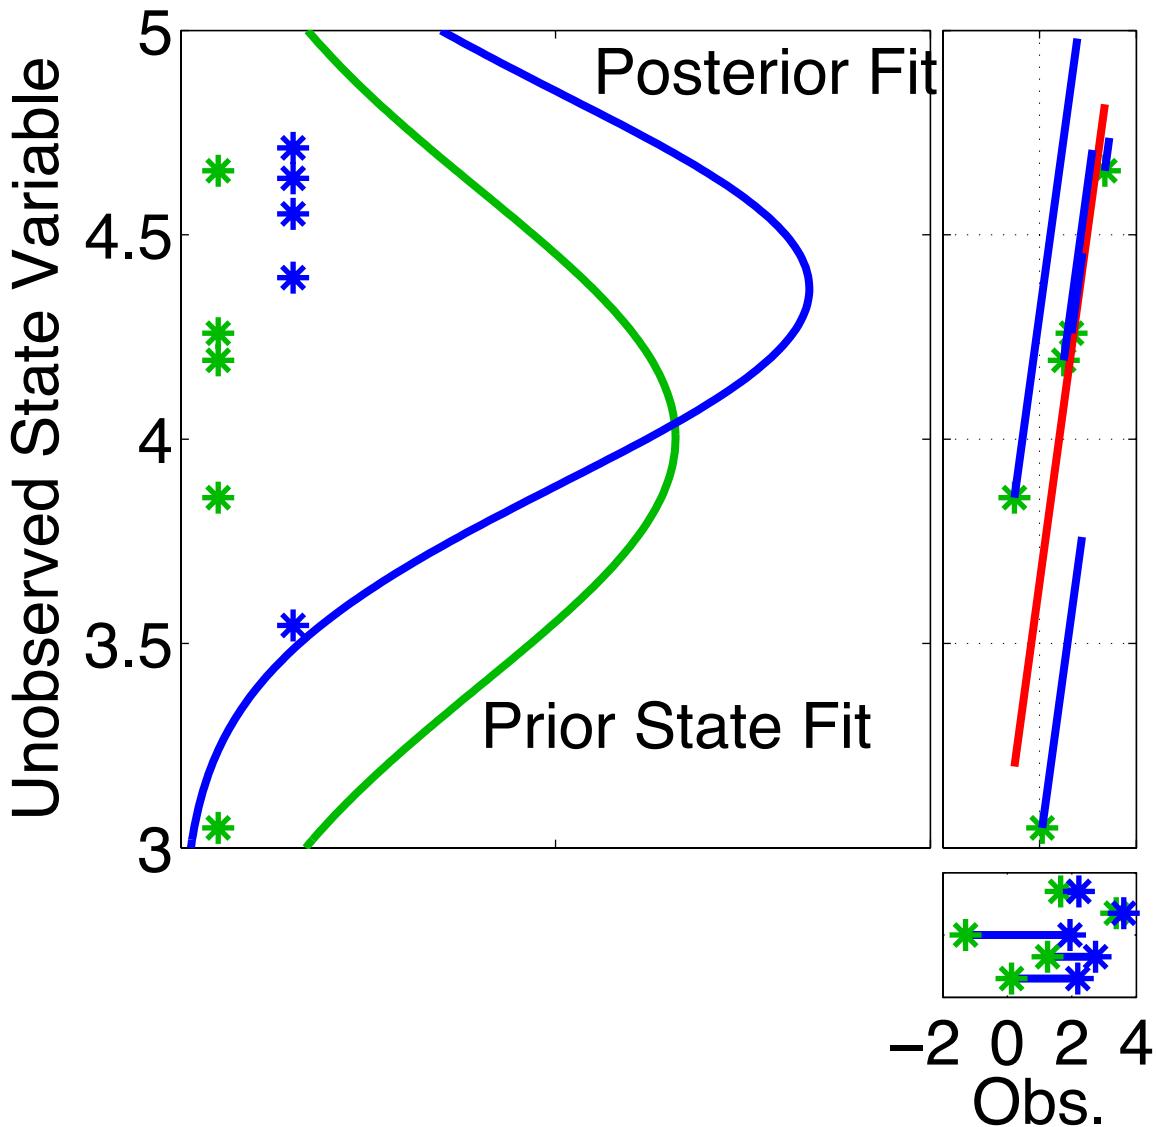

# Ensemble filters: Updating additional prior state variables

Now have an updated (posterior) ensemble for the unobserved variable.

Fitting Gaussians shows that mean and variance have changed.

# Ensemble filters: Updating additional prior state variables

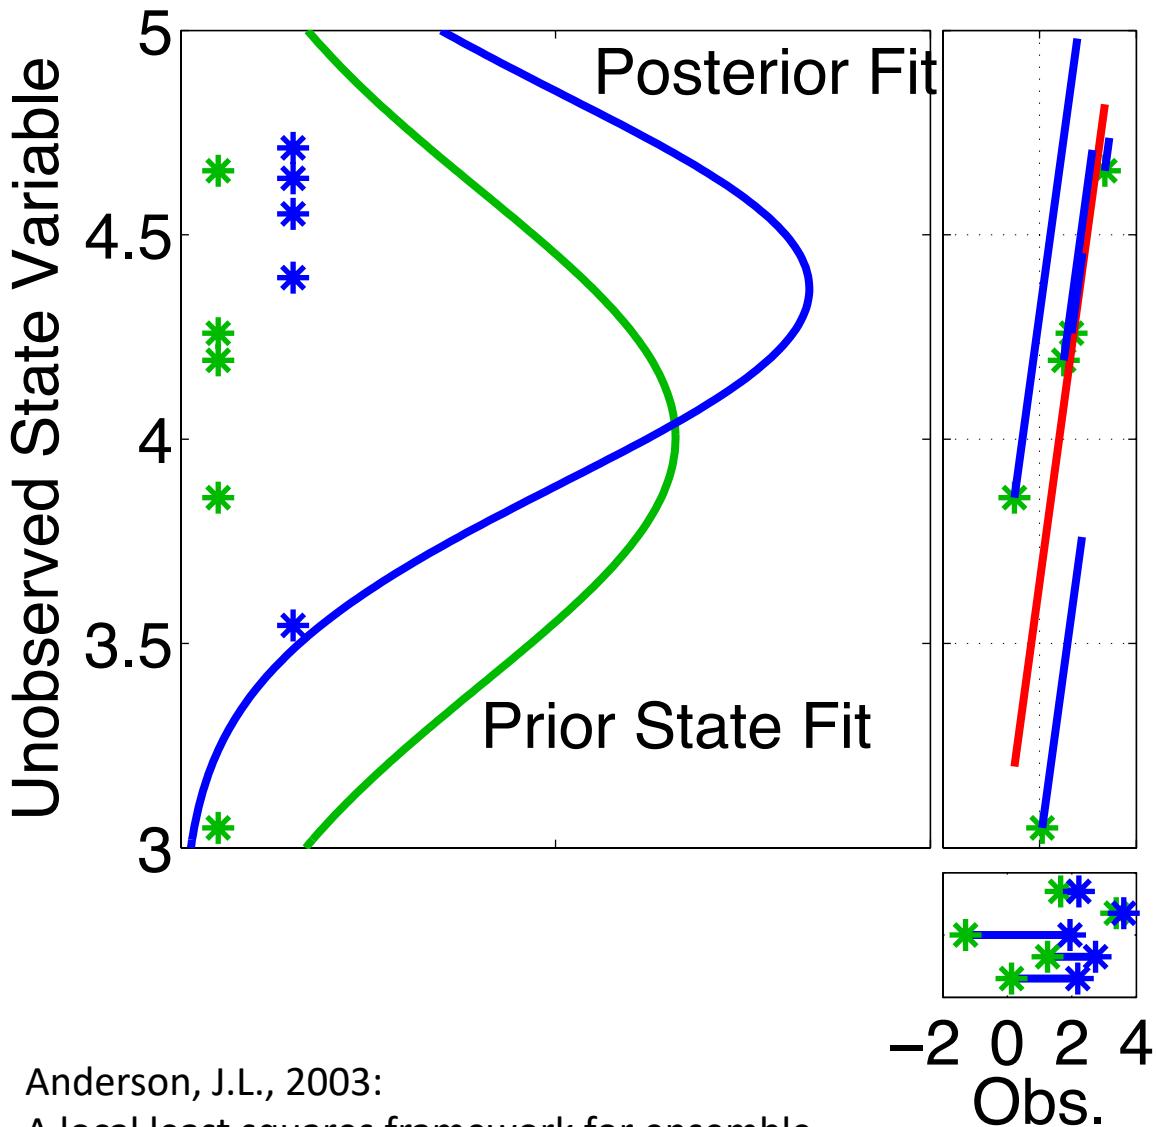

Now have an updated (posterior) ensemble for the unobserved variable.

Fitting Gaussians shows that mean and variance have changed.

Other features of the prior distribution may also have changed.

# Ensemble filters: Updating additional prior state variables

Anderson, J.L., 2003:  
A local least squares framework for ensemble  
filtering. *Mon. Wea. Rev.*, **131**, 634-642

**CRITICAL POINT:**  
Since impact on  
unobserved variable is  
simply a linear  
regression, can do this  
**INDEPENDENTLY** for any  
number of unobserved  
variables!

Could also do many at  
once using matrix algebra  
as in traditional Kalman  
Filter.

# Matlab Hands-On: twod\_ensemble

Bivariate ensemble plot with projected marginals for observed, unobserved variables.

Start creating an ensemble. See next slide.

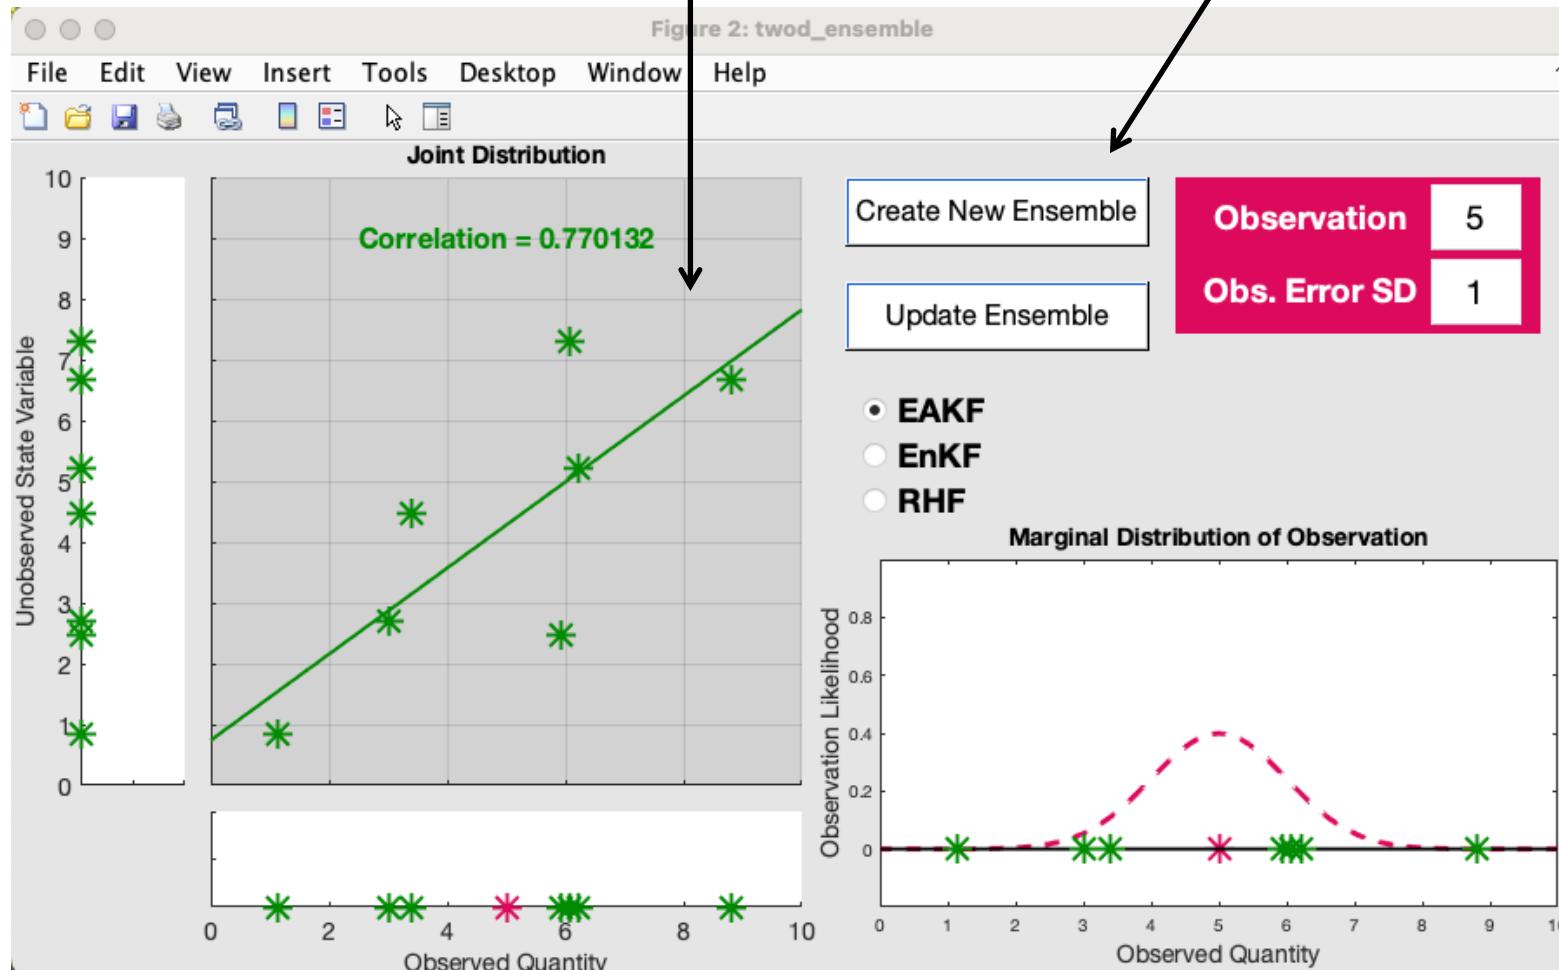

Control observation value and error; same as oned\_ensemble.

Detailed plot for observed variable; same as oned\_ensemble.

# Matlab Hands-On: twod\_ensemble

Move cursor and click in this frame to create ensemble members. Click outside this frame when all members are created.

Start creating an ensemble.

# Matlab Hands-On: twod\_ensemble

## Explorations:

- Create ensemble members that are nearly on a line. Explore how the unobserved variable is updated.
- What happens for nearly uncorrelated observed and unobserved variables? Create a roundish cloud of points for the prior.
- What happens with a two-dimensional bimodal distribution?
- Try prior ensembles with various types of outliers.

# Summary of Key Points so Far

We know how to:

1. Assimilate a single observation of a single state variable with normal distributions.
2. Cyclically assimilate multiple observations at the same time if their error distributions are independent.
3. Do cycled DA for a single variable and single observation with normal distributions (Kalman Filter).
4. Duplicate cycled DA results using an ensemble of model forecasts for the prior and fitting a normal to the ensemble prior (Ensemble Adjustment Kalman Filter).
5. Update any number of additional variables given an observation using ensemble increment regression.

Combining these things, we have a framework for doing cycled ensemble DA with any number of ‘identity’ observations of model state variables at each time.

# Schematic of an Ensemble Filter for Geophysical Data Assimilation

1. Use model to advance **ensemble** (3 members here) to time at which next observation(s) becomes available.

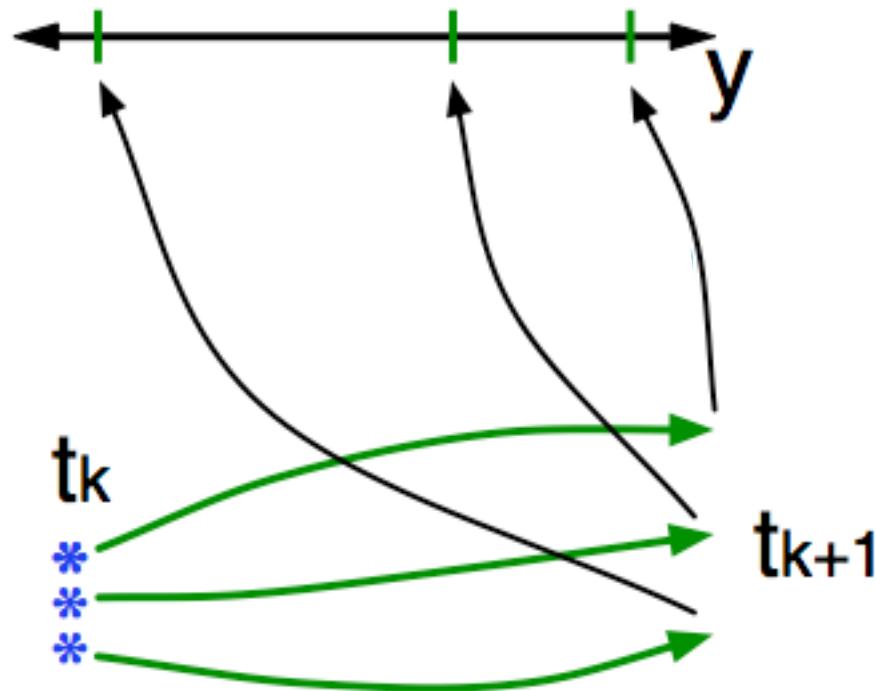

Ensemble state  
estimate after using  
previous observation  
**(analysis)**

Ensemble state  
at time of next  
observation  
**(prior)**

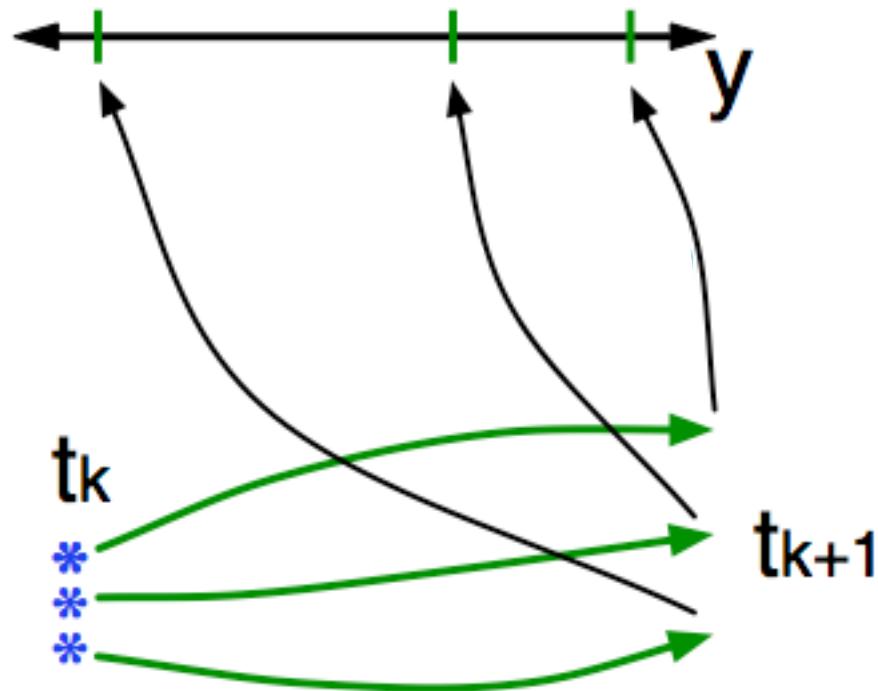

# Schematic of an Ensemble Filter for Geophysical Data Assimilation

2. Get the ensemble of values of the first observation to be assimilated at this time (observation is of a state variable).

# Schematic of an Ensemble Filter for Geophysical Data Assimilation

2. Get the ensemble of values of the first observation to be assimilated at this time (observation is of a state variable).

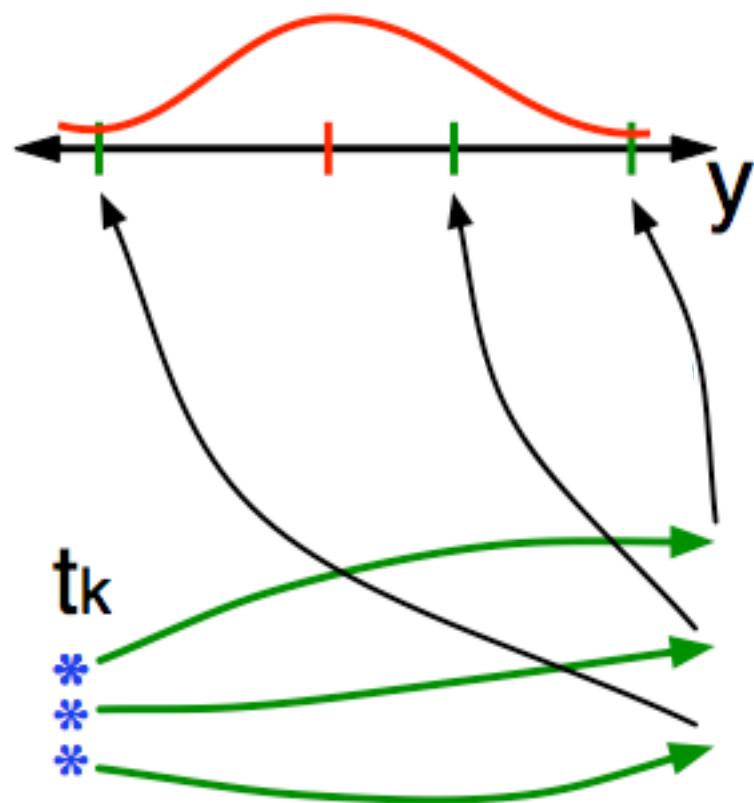

Theory: observations from instruments with uncorrelated errors can be done sequentially.

Houtekamer, P.L. and H.L. Mitchell, 2001:  
A sequential ensemble Kalman filter for atmospheric data assimilation.  
*Mon. Wea. Rev.*, **129**, 123-137

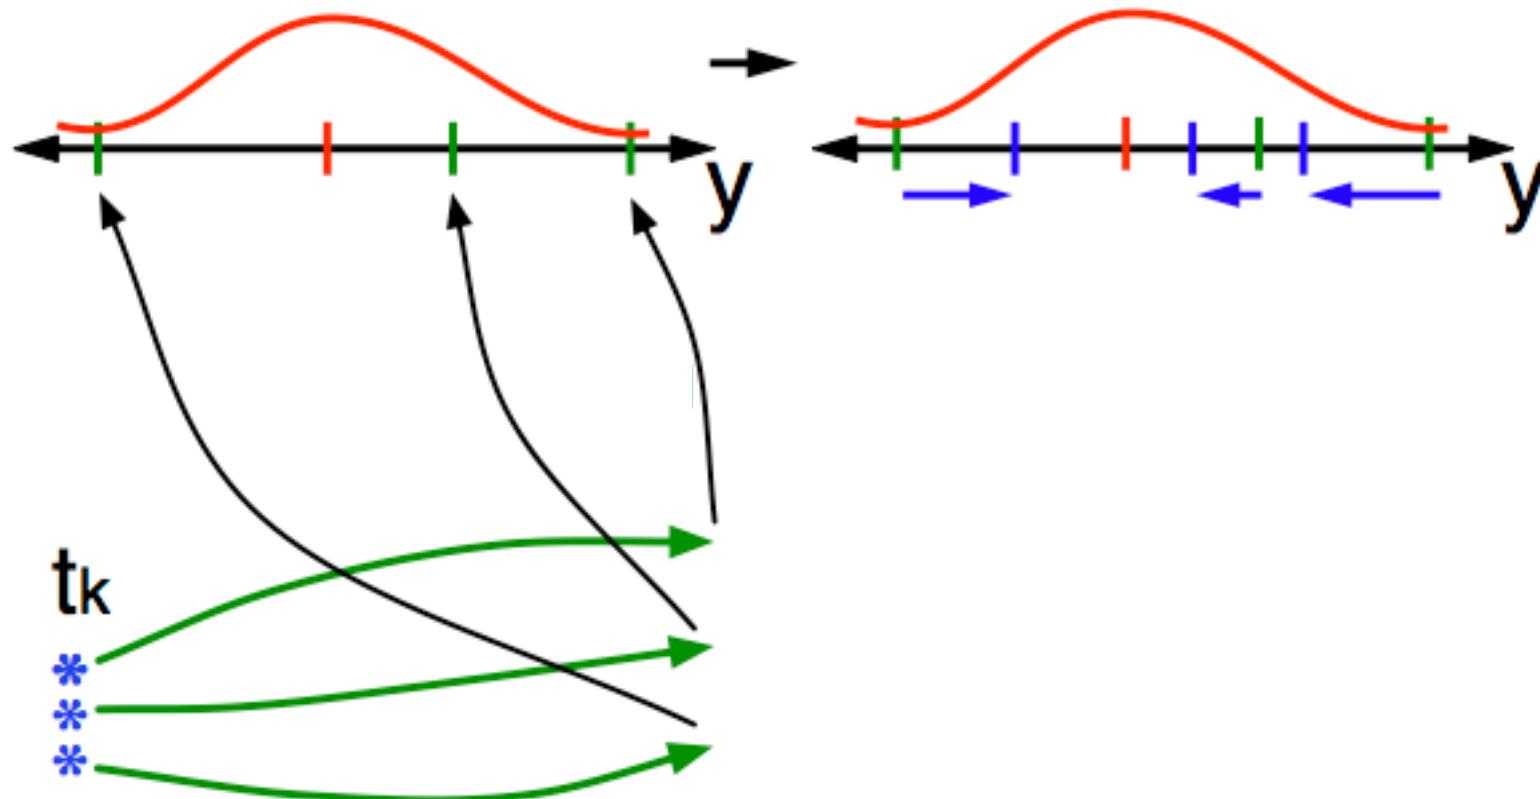

# Schematic of an Ensemble Filter for Geophysical Data Assimilation

3. Get **observed value** and **likelihood** from observing system.

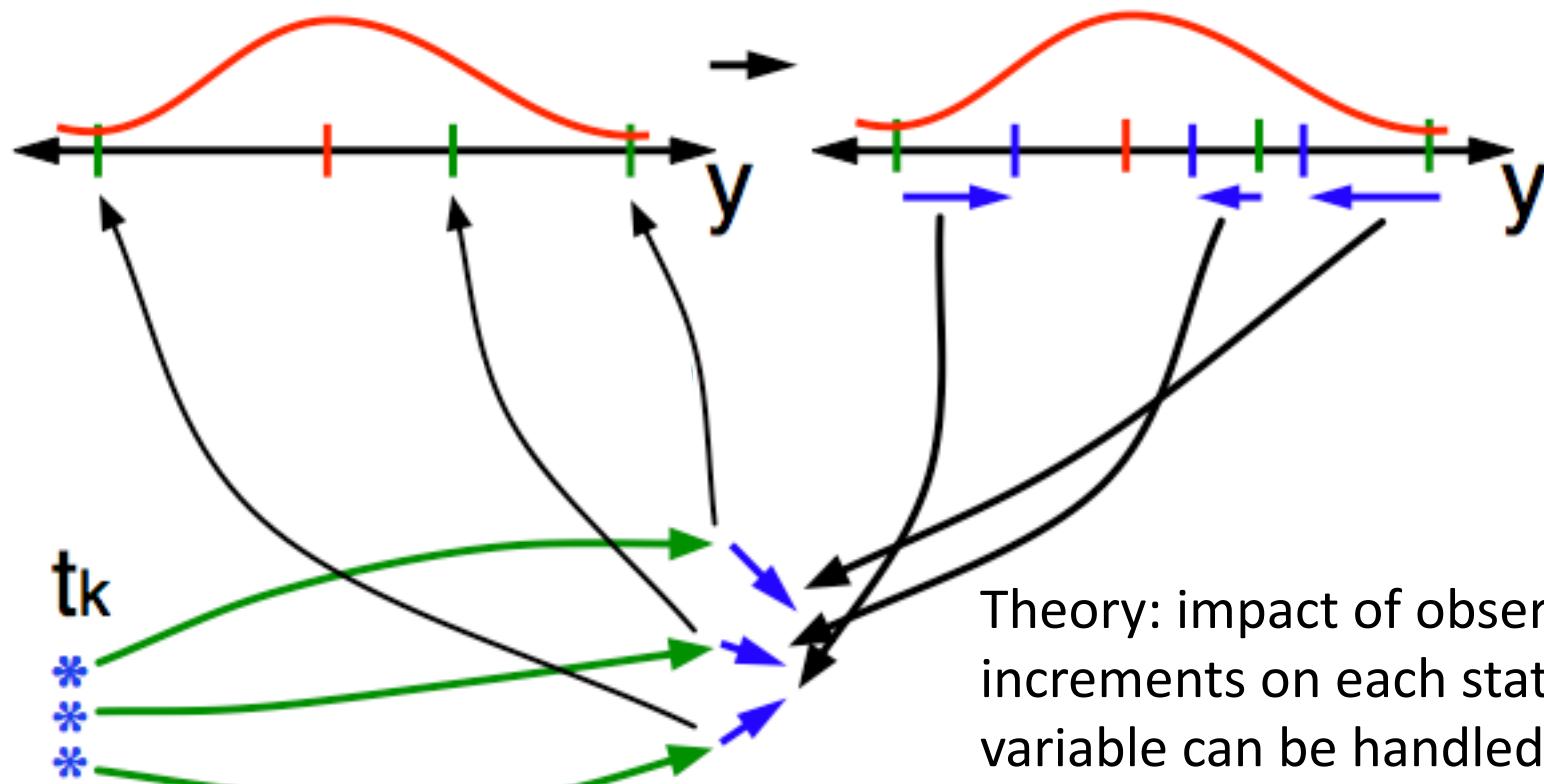

# Schematic of an Ensemble Filter for Geophysical Data Assimilation

4. Find the **increments** for the prior observation ensemble, this is a scalar problem.

# Schematic of an Ensemble Filter for Geophysical Data Assimilation

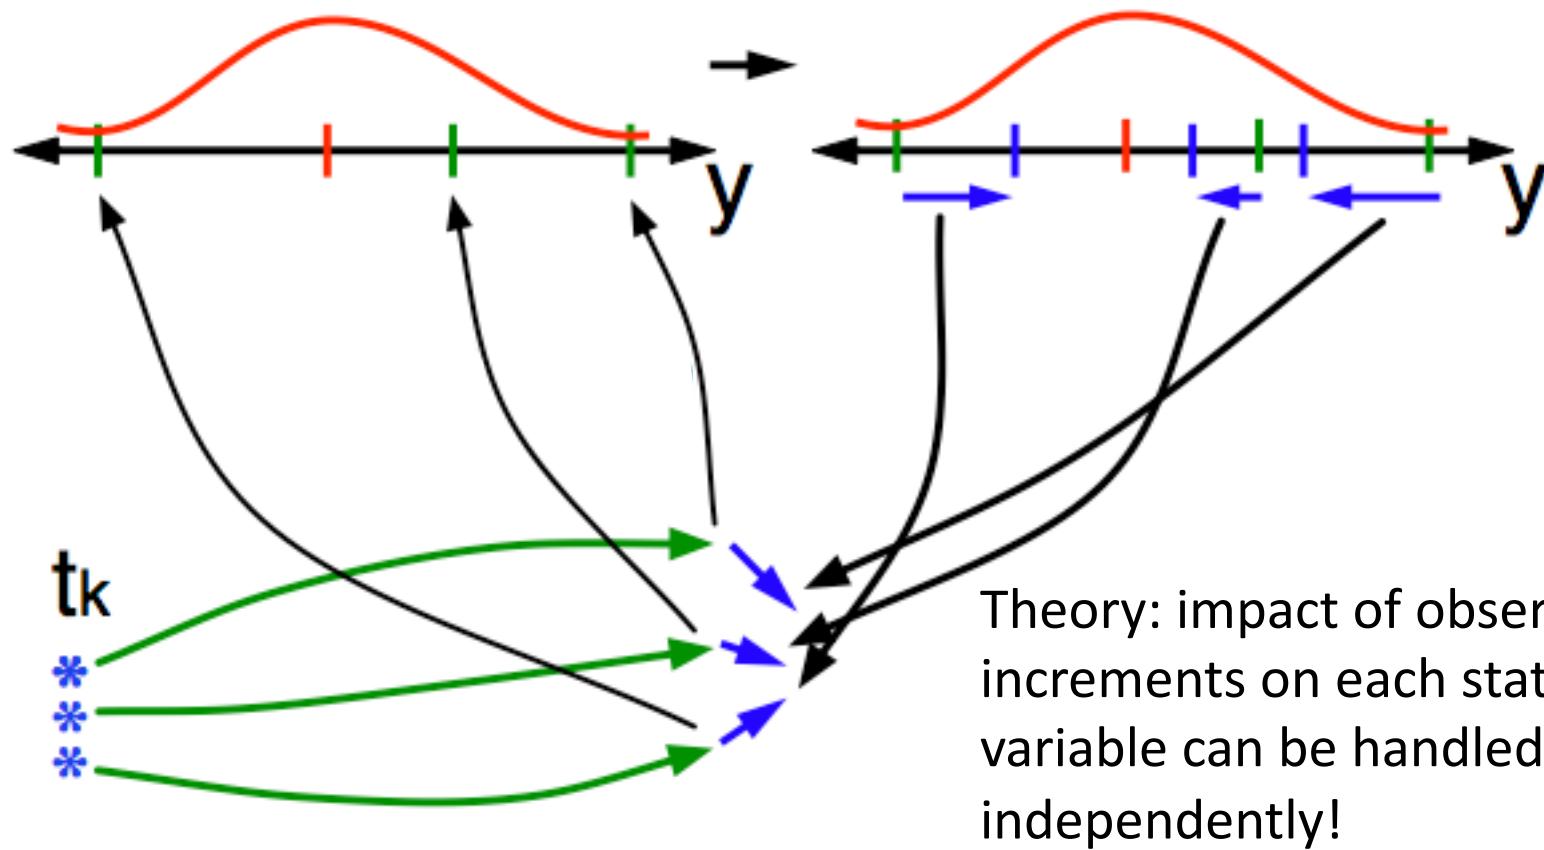

5. Use ensemble samples of  $y$  and each state variable to linearly regress observation increments onto state variable increments.

Theory: impact of observation increments on each state variable can be handled independently!

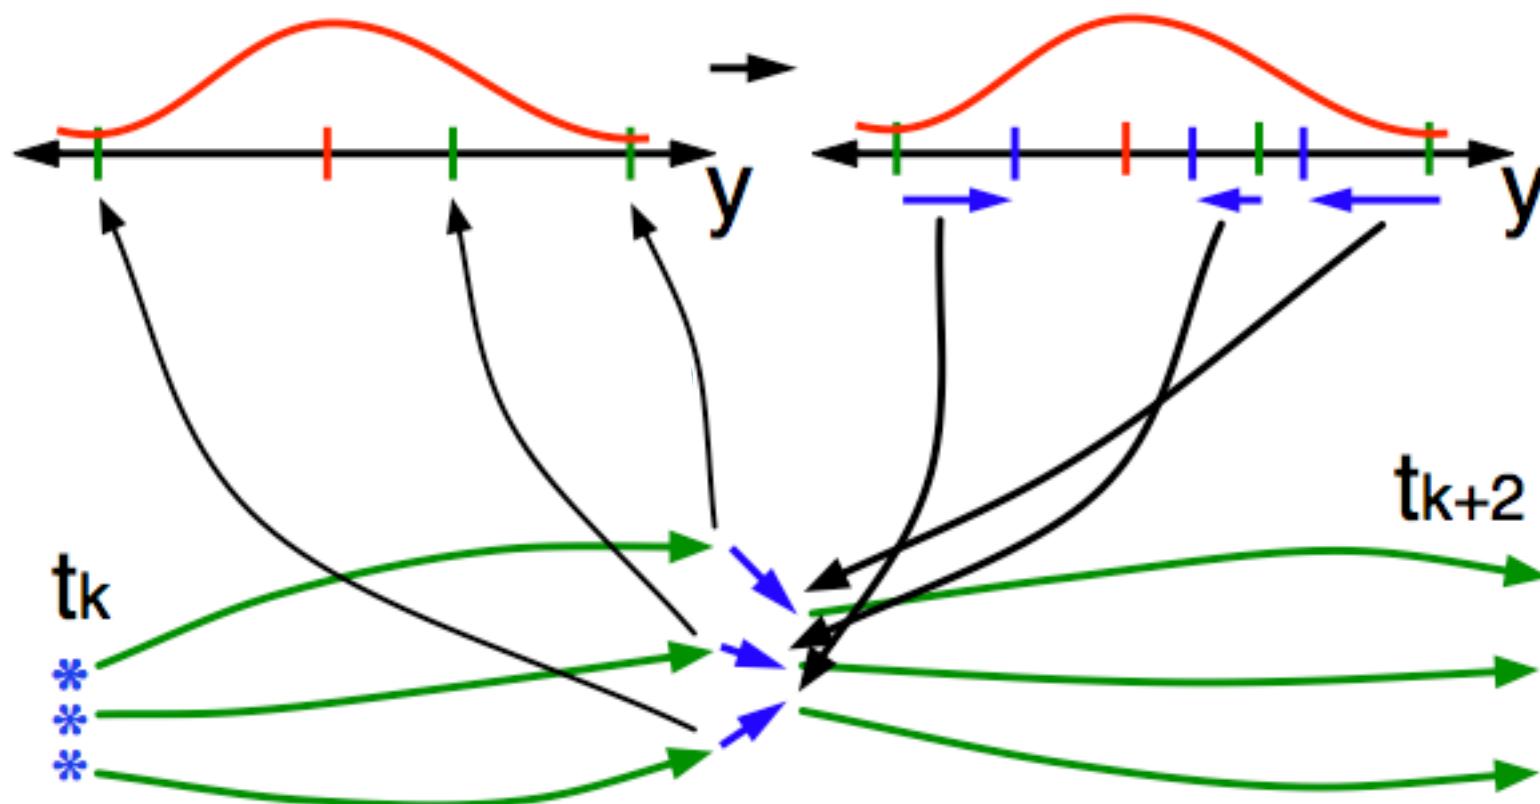

# Schematic of an Ensemble Filter for Geophysical Data Assimilation

Repeat steps 2-5 sequentially for each observation at this time.

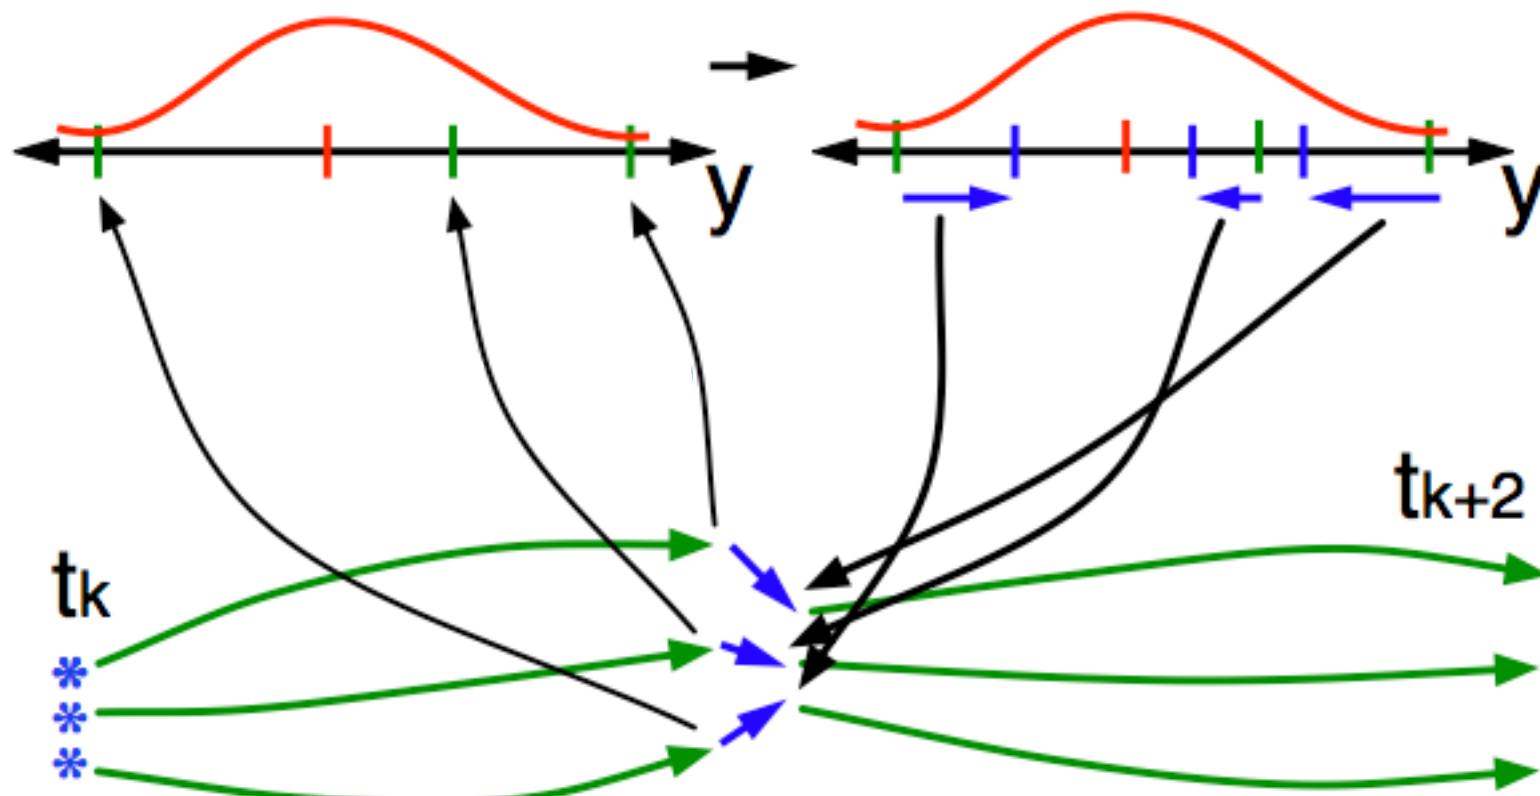

# Schematic of an Ensemble Filter for Geophysical Data Assimilation

- When all observations at this time are assimilated, integrate model state to the next time with observations.

# Schematic of an Ensemble Filter for Geophysical Data Assimilation

**Reminder:** This schematic has assumed that observations are ‘identity’ observations of model state variables.

# Data Assimilation: A somewhat general description

A time-varying state-vector  $\mathbf{x}_t$ ,

# Data Assimilation: A somewhat general description

A time-varying state-vector  $\mathbf{x}_t$ ,

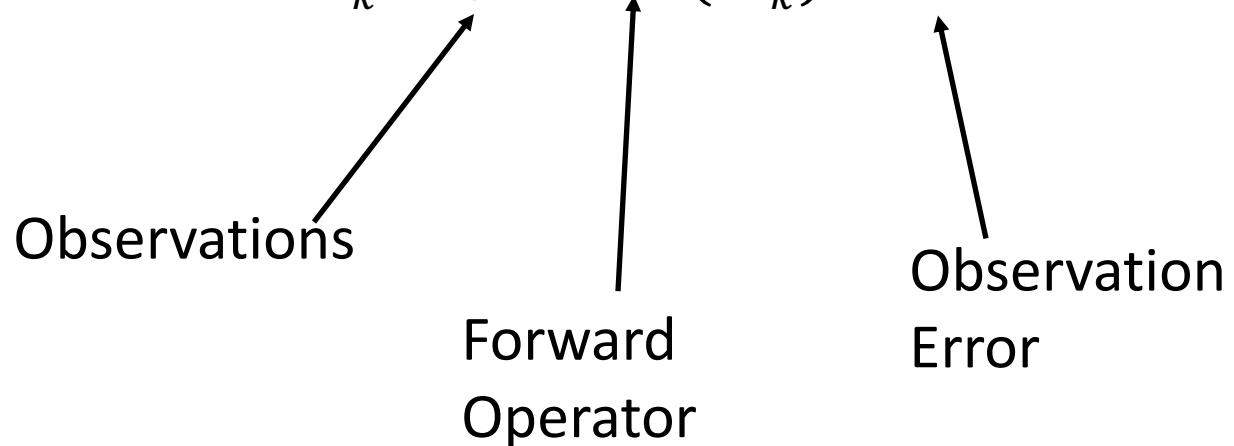

Times  $t_k$  with observations:  $k = 1, 2, \dots$ ;  $t_{k+1} > t_k \geq t_0$ ,

# Data Assimilation: A somewhat general description

A time-varying state-vector  $\mathbf{x}_t$ ,

Times  $t_k$  with observations:  $k = 1, 2, \dots$ ;  $t_{k+1} > t_k \geq t_0$ ,

Observations at  $t_k$  related to  $\mathbf{x}_{t_k}$ ;  $\mathbf{y}_k = h_k(\mathbf{x}_{t_k}) + \nu_k$ , (1)

# Data Assimilation: A somewhat general description

A time-varying state-vector  $\mathbf{x}_t$ ,

Times  $t_k$  with observations:  $k = 1, 2, \dots$ ;  $t_{k+1} > t_k \geq t_0$ ,

Observations at  $t_k$  related to  $\mathbf{x}_{t_k}$ ;  $\mathbf{y}_k = h_k(\mathbf{x}_{t_k}) + \nu_k$ , (1)

Observation error is zero mean, normal,  $\nu_k = N(0, \mathbf{R}_k)$ , (2)

Observation  
Error  
Covariance

We assume  $\mathbf{R}_k$  is diagonal (observation errors are uncorrelated for different observations) for the rest of the tutorial.

# Data Assimilation: A somewhat general description

A time-varying state-vector  $\mathbf{x}_t$ ,

Times  $t_k$  with observations:  $k = 1, 2, \dots$ ;  $t_{k+1} > t_k \geq t_0$ ,

Observations at  $t_k$  related to  $\mathbf{x}_{t_k}$ ;  $\mathbf{y}_k = h_k(\mathbf{x}_{t_k}) + \nu_k$ , (1)

Observation error is zero mean, normal,  $\nu_k = N(0, \mathbf{R}_k)$ , (2)

A forecast model  $m$  for the state-vector;  $\mathbf{x}_{t_{k+1}} = m_{k:k+1}(\mathbf{x}_{t_k})$  (3)

# Data Assimilation: A somewhat general description

A time-varying state-vector  $\mathbf{x}_t$ ,

Times  $t_k$  with observations:  $k = 1, 2, \dots$ ;  $t_{k+1} > t_k \geq t_0$ ,

Observations at  $t_k$  related to  $\mathbf{x}_{t_k}$ ;  $\mathbf{y}_k = h_k(\mathbf{x}_{t_k}) + \nu_k$ , (1)

Observation error is zero mean, normal,  $\nu_k = N(0, \mathbf{R}_k)$ , (2)

A forecast model  $m$  for the state-vector;  $\mathbf{x}_{t_{k+1}} = m_{k:k+1}(\mathbf{x}_{t_k})$  (3)

$m$  can have deterministic and stochastic parts;

$$m_{k:k+1}(\mathbf{x}_{t_k}) = f_{k:k+1}(\mathbf{x}_{t_k}) + g_{k:k+1}(\mathbf{x}_{t_k}). \quad (4)$$

# Data Assimilation: A somewhat general description

Define the set of all observations taken no later than time  $t_k$ :

$$\mathbf{Y}_k = \{\mathbf{y}_i; i \leq k\} \quad (5)$$

Problems of interest are:

Analysis:  $P(\mathbf{x}_t | \mathbf{Y}_k), \quad t = t_k \quad (6)$

Forecast:  $P(\mathbf{x}_t | \mathbf{Y}_k), \quad t > t_k \quad (7)$

Smoother:  $P(\mathbf{x}_t | \mathbf{Y}_k), \quad t < t_k \quad (8)$

# Data Assimilation: A somewhat general description

Define the set of all observations taken no later than time  $t_k$ :

$$\mathbf{Y}_k = \{\mathbf{y}_i; i \leq k\} \quad (5)$$

Problems of interest are:

Analysis:  $P(\mathbf{x}_t | \mathbf{Y}_k), \quad t = t_k \quad (6)$

Forecast:  $P(\mathbf{x}_t | \mathbf{Y}_k), \quad t > t_k \quad (7)$

Smoother:  $P(\mathbf{x}_t | \mathbf{Y}_k), \quad t < t_k \quad (8)$

Note: could also replace  $\mathbf{x}_t$  with any of the other things data assimilation can estimate: parameters, initial conditions, ...

# Data Assimilation: A somewhat general description

Forecasts of state,  $\mathbf{x}$  are obtained from model.

Need to update forecast state given new observations:

$$P(\mathbf{x}_{t_k} | \mathbf{Y}_k) = P(\mathbf{x}_{t_k} | \mathbf{y}_k, \mathbf{Y}_{k-1})$$

Bayes' rule:

$$P(\mathbf{x}_{t_k} | \mathbf{Y}_k) = \frac{P(\mathbf{y}_k | \mathbf{x}_{t_k}, \mathbf{Y}_{k-1}) P(\mathbf{x}_{t_k} | \mathbf{Y}_{k-1})}{P(\mathbf{y}_k | \mathbf{Y}_{k-1})} \quad (9)$$

Observation errors uncorrelated in time:

$$P(\mathbf{y}_k | \mathbf{x}_{t_k}, \mathbf{Y}_{k-1}) = P(\mathbf{y}_k | \mathbf{x}_{t_k})$$

Denominator in (9) is normalization, makes update a pdf.

# Data Assimilation: A somewhat general description

Probability after new observation:

$$P(\mathbf{x}_{t_k} | \mathbf{Y}_k) = \frac{P(\mathbf{y}_k | \mathbf{x}) P(\mathbf{x}_{t_k} | \mathbf{Y}_{k-1})}{\text{Normalization}} \quad (10)$$

Diagram illustrating the components of the assimilation equation:

- Likelihood**: Points to the term  $P(\mathbf{y}_k | \mathbf{x})$  in red.
- Prior (forecast)**: Points to the term  $P(\mathbf{x}_{t_k} | \mathbf{Y}_{k-1})$  in green.
- Posterior (analysis)**: Points to the left side of the equation  $P(\mathbf{x}_{t_k} | \mathbf{Y}_k)$ .

# Data Assimilation: A somewhat general description

Probability after new observation:

$$P(\mathbf{x}_{t_k} | \mathbf{Y}_k) = \frac{P(\mathbf{y}_k | \mathbf{x}) P(\mathbf{x}_{t_k} | \mathbf{Y}_{k-1})}{\text{Normalization}} \quad (10)$$

↑  
Likelihood      Prior (forecast)  
↓

Posterior (analysis).

Forecasts produced by applying model to analysis.

Smoother can be derived from a similar Bayesian analysis.

# Data Assimilation: A revised description

Define extended state vector that combines model state and obs:

$$\hat{\mathbf{x}}_{t_k} \equiv [\mathbf{x}_{t_k}, \mathbf{y}_k]$$

An extended forecast model  $\hat{m}$ ;

$$\begin{aligned}\hat{\mathbf{x}}_{t_{k+1}} &= \hat{m}_{k:k+1}(\mathbf{x}_{t_k}) \equiv [\mathbf{x}_{t_{k+1}}, h_{k+1}(\mathbf{x}_{t_{k+1}})] = \\ &[m_{k:k+1}(\mathbf{x}_{t_k}), h_{k+1}(m_{k:k+1}(\mathbf{x}_{t_k}))]\end{aligned}$$

Observations at  $t_k$  related to  $\hat{\mathbf{x}}_{t_k}$  by ‘identity’ forward operator;

$$\mathbf{y}_k = \hat{H}_k(\hat{\mathbf{x}}_{t_k}) + \nu_k,$$

$\hat{H}_k$  has row for each observation, column for each extended state element.

# Data Assimilation: A revised description

Observations at  $t_k$  related to  $\hat{\mathbf{x}}_{t_k}$  by ‘identity’ forward operator;

$$\mathbf{y}_k = \hat{H}_k(\hat{\mathbf{x}}_{t_k}) + \nu_k,$$

$\hat{H}_k$  is linear, so it can be represented by a matrix.

Has a row for each observation, a column for each extended state element.

All zeros except a diagonal of 1’s in the last number of obs columns.

This example has a 5-element model state vector and 4 observations

$$\hat{H}_k = \begin{matrix} 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{matrix}$$

# Data Assimilation: A revised description

A time-varying extended state-vector  $\hat{\mathbf{x}}_t$ ,

Times  $t_k$  with observations:  $k = 1, 2, \dots$ ;  $t_{k+1} > t_k \geq t_0$ ,

Observations at  $t_k$  related to  $\hat{\mathbf{x}}_{t_k}$ ;  $\mathbf{y}_k = \hat{H}_k(\hat{\mathbf{x}}_{t_k}) + \nu_k$ , (1)

Observation error is zero mean, normal,  $\nu_k = N(0, \mathbf{R}_k)$ , (2)

A forecast model  $\hat{m}$  for the state-vector;  $\hat{\mathbf{x}}_{t_{k+1}} = \hat{m}_{k:k+1}(\mathbf{x}_{t_k})$  (3)

$\hat{m}$  can have deterministic and stochastic parts;

$$\hat{m}_{k:k+1}(\mathbf{x}_{t_k}) = \hat{f}_{k:k+1}(\mathbf{x}_{t_k}) + \hat{g}_{k:k+1}(\mathbf{x}_{t_k}). \quad (4)$$

# Schematic of an Ensemble Filter for Geophysical Data Assimilation

(This is implemented in DART Fortran code)

1. Use model to advance **ensemble** (3 members here) to time at which next observation(s) becomes available, **and compute forward operators for all observations for each ensemble.**

# Schematic of an Ensemble Filter for Geophysical Data Assimilation

(This is implemented in DART Fortran code)

- When all observations are assimilated, integrate model state to the next time that has observations.

# Matlab Hands-On: run\_lorenz\_63

Purpose: Explore behavior of ensemble Kalman filters in a low-order, chaotic dynamical system, the 3-variable Lorenz 1963 model.

These controls work the same as for oned\_model.

Assimilation can be turned off, just does model advances.

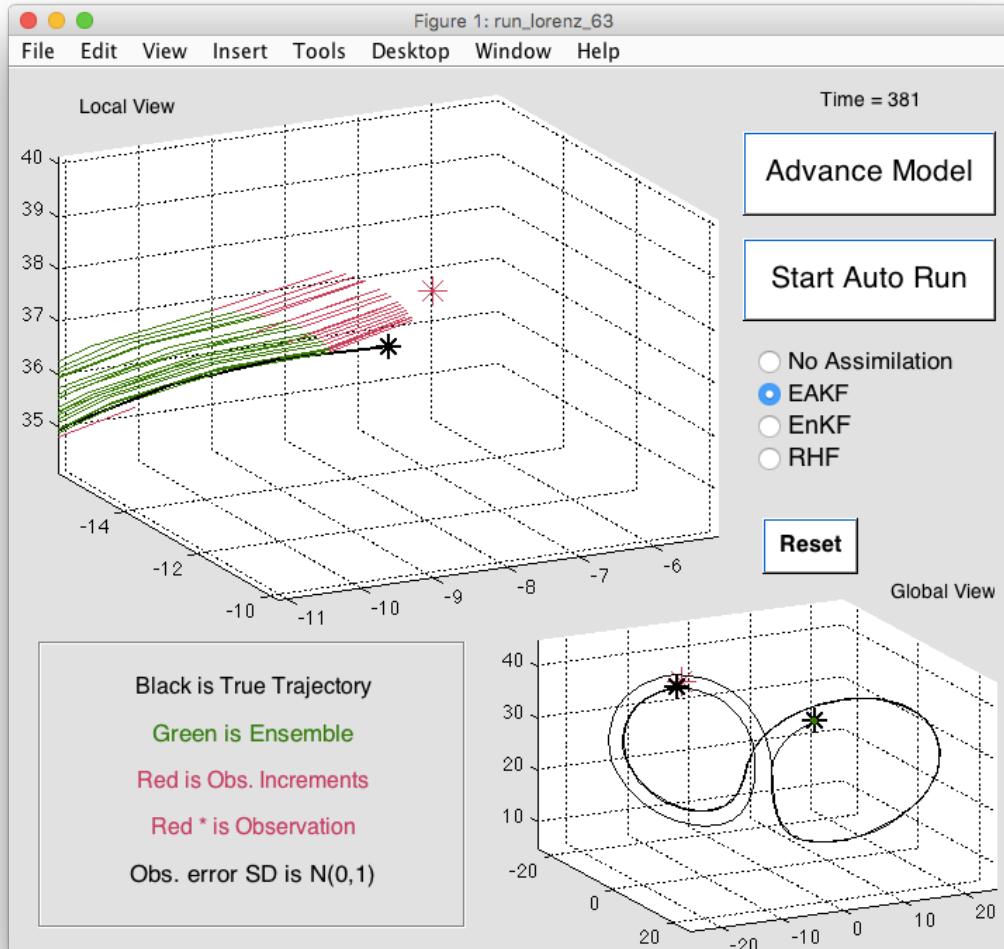

‘Local’ domain,  
local timeframe

Full domain,  
full timeframe.

# Matlab Hands-On: run\_lorenz\_63

Both panels show time evolution of true state (black).

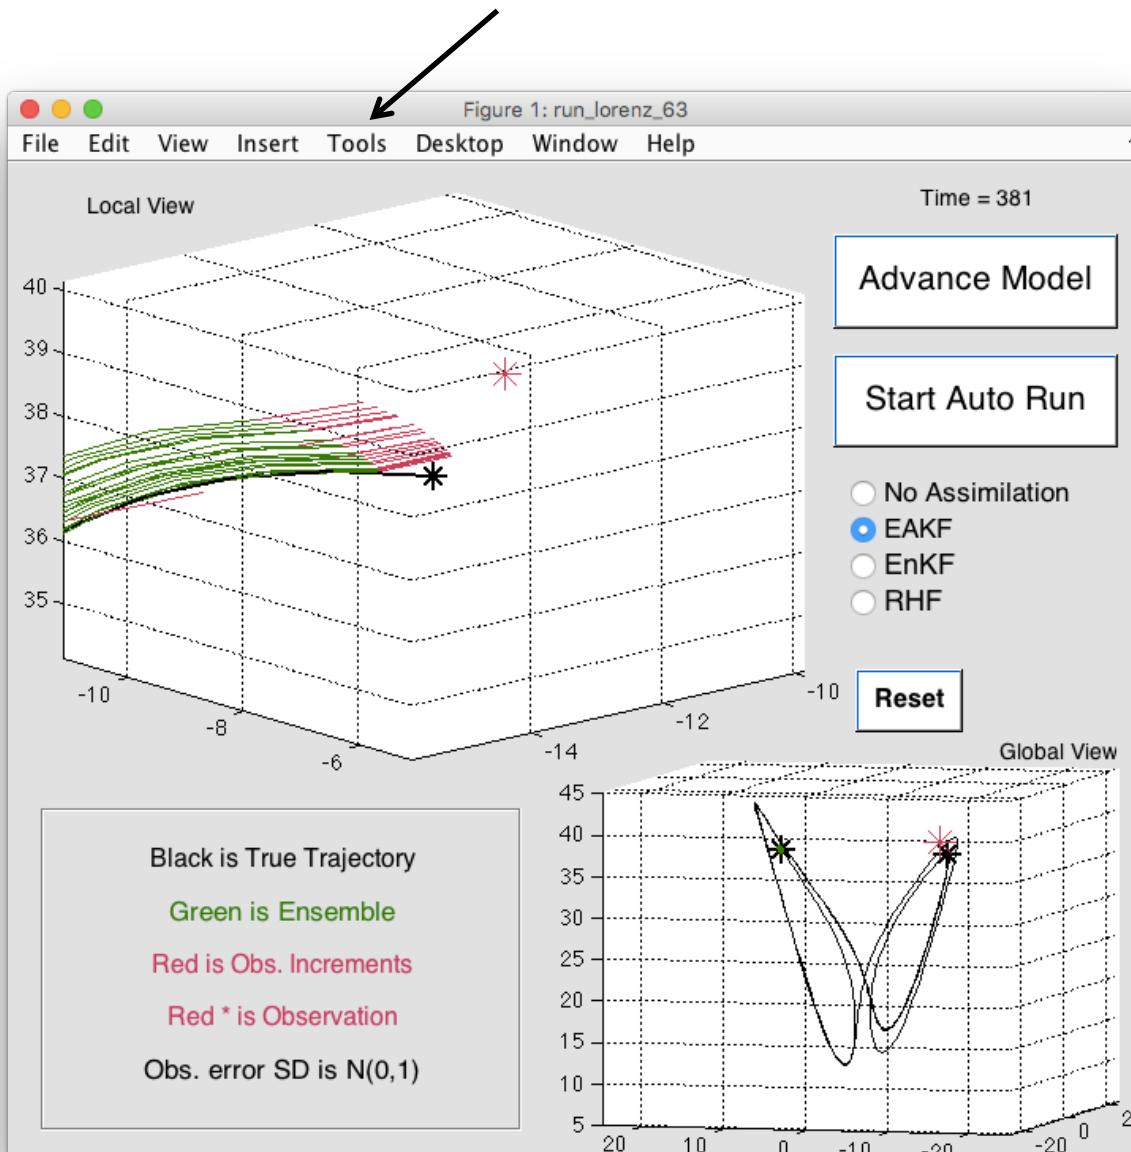

20 ensemble members are shown in green in top window.

At each observation time, the three components of the truth are 'observed' by adding a random draw from a standard normal distribution to the true value.

# Matlab Hands-On: run\_lorenz\_63

You can use Matlab tools to modify plots.

Here, the Rotate 3D tool has been used to change the angle of view of both the local and global views of the assimilation.

# Matlab Hands-On: run\_lorenz\_63

## Explorations:

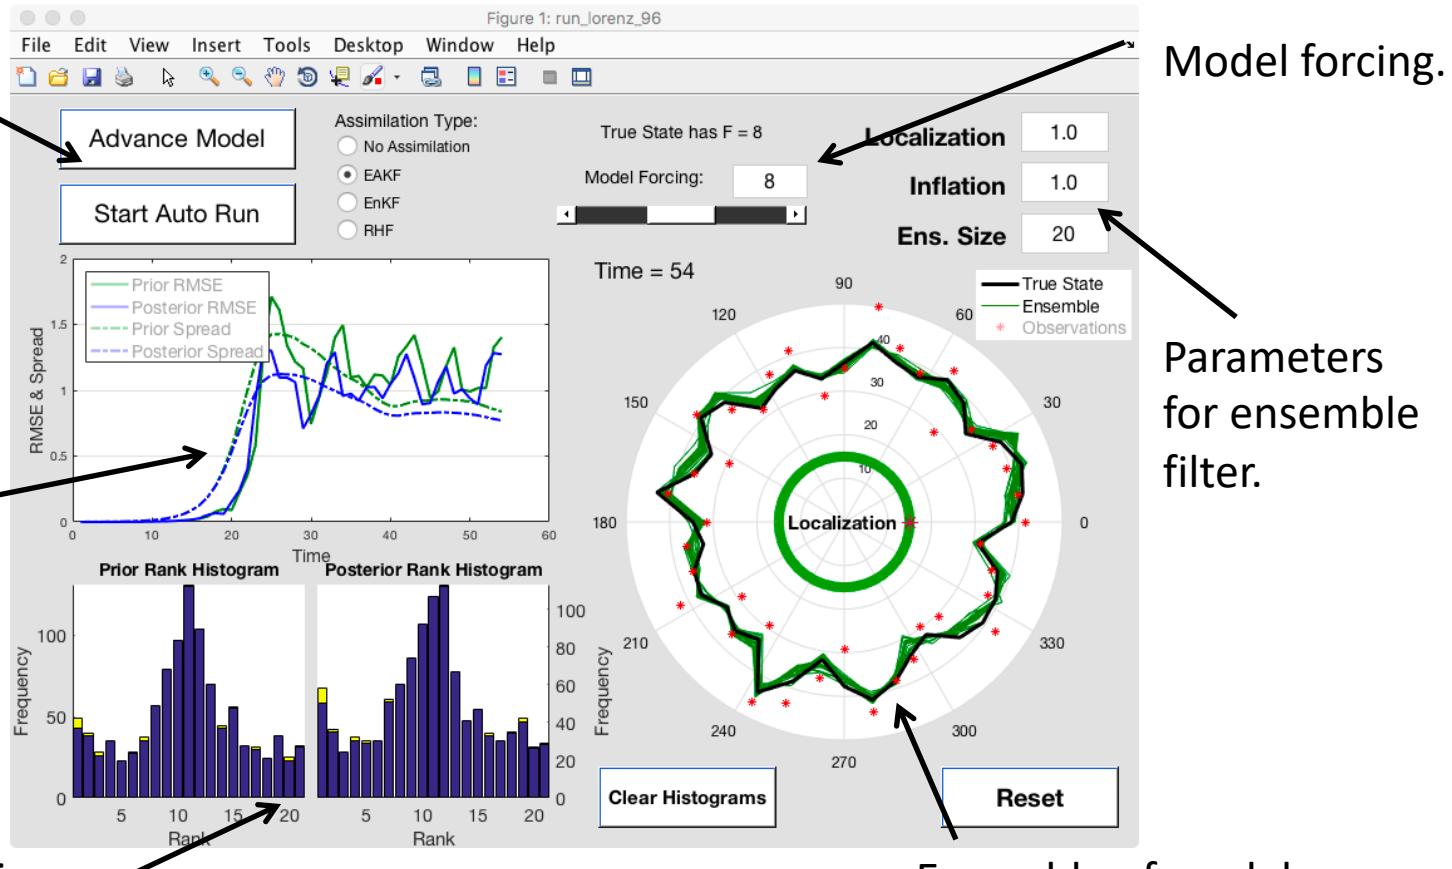

- Select **Start Auto Run** and watch the evolution of the ensemble.  
Try to understand how the ensemble spreads out.
- Restart the GUI and select **EAKF**. Do individual advances and assimilations and observe the behavior.
- Do some auto runs with assimilation turned on.
- Explore how different areas of the attractor have different assimilation behavior.

# Matlab Hands-On: run\_lorenz\_96

Purpose: Explore the behavior of ensemble filters in a 40-variable chaotic dynamical system; the Lorenz 1996 model.

These controls work the same as lorenz\_63.

Root mean square error from truth and ensemble spread as function of time.

Prior and posterior rank histograms.

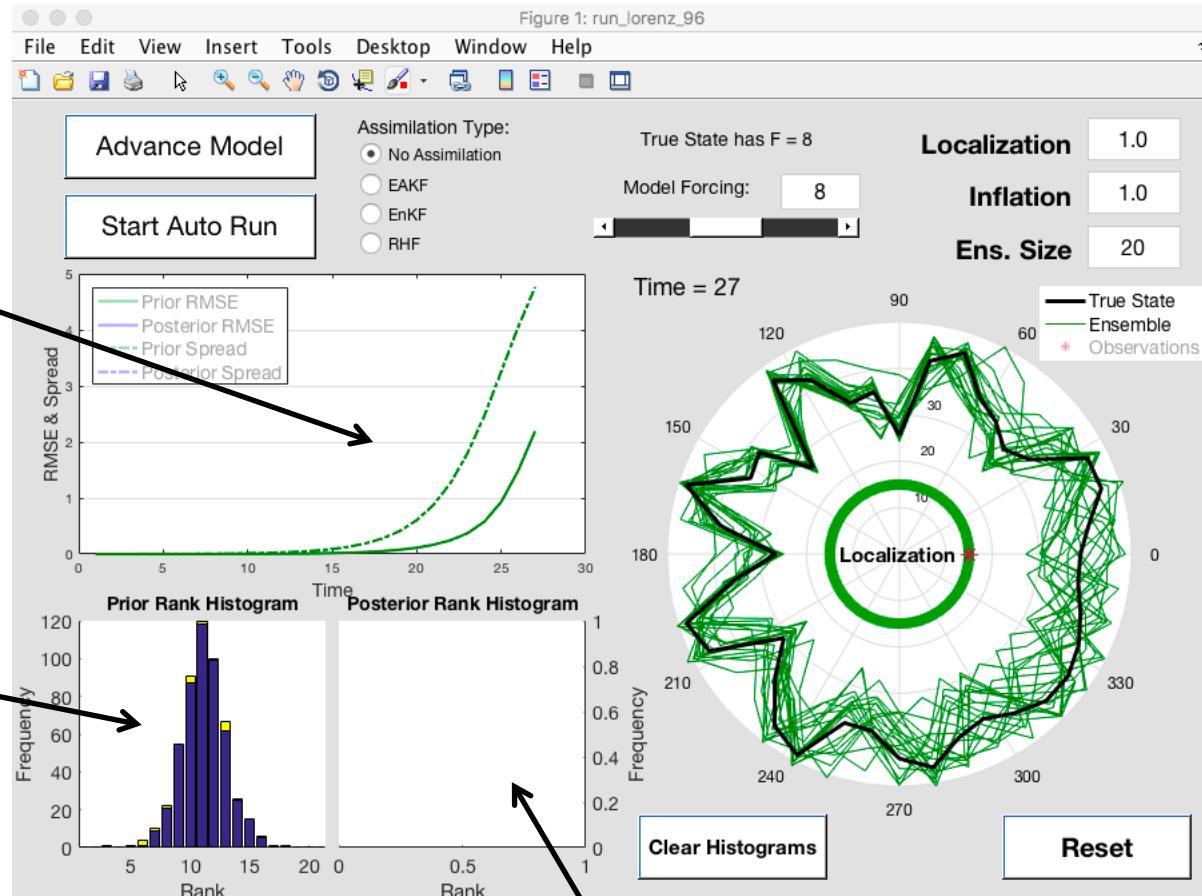

Model forcing.

Parameters for ensemble filter.

Ensemble of model contours (spaghetti plot).

# Matlab Hands-On: run\_lorenz\_96

Start a Free Run of the ensemble (No Assimilation). After some time, the minute perturbations in the original states lead to visibly different model states.

Takes a while for the small initial perturbations to grow.

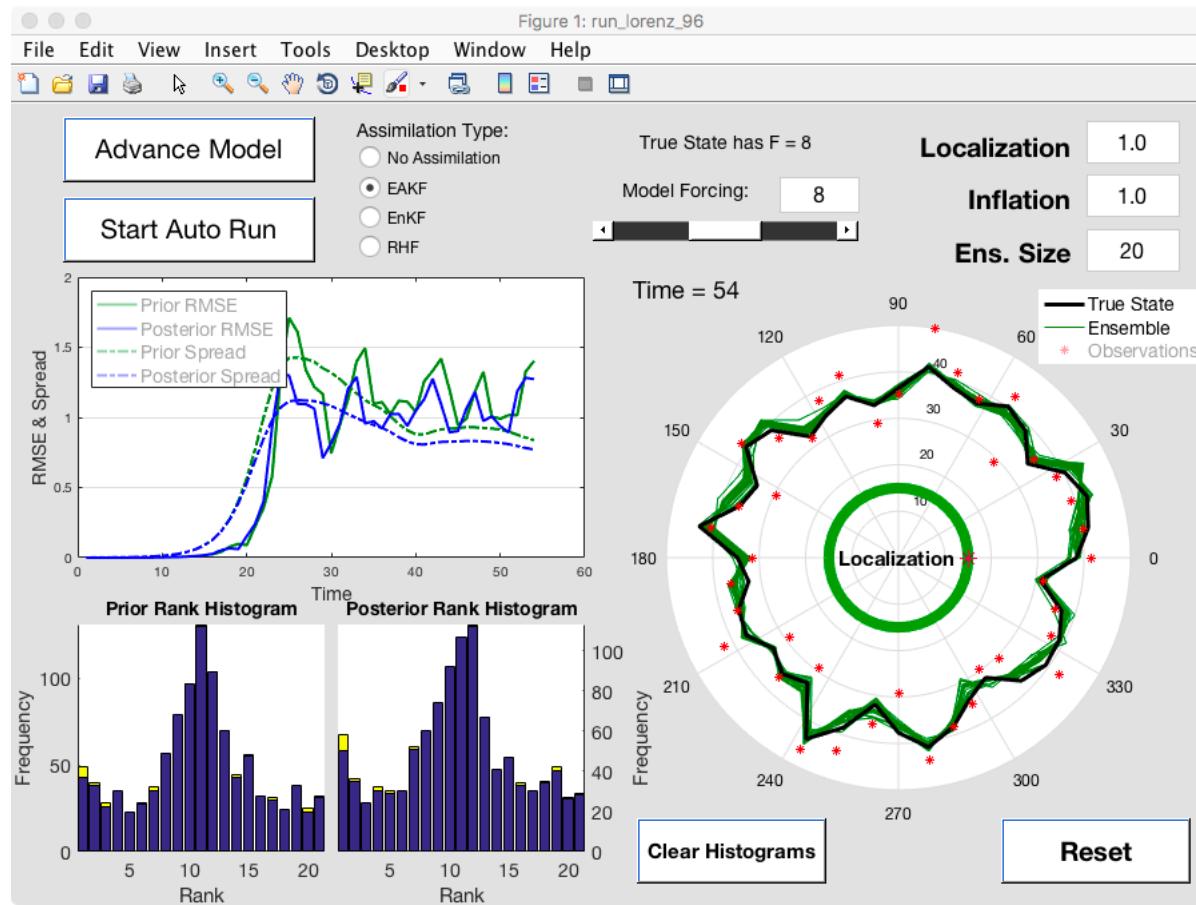

Ensemble size is 20, so there are 21 bins in the rank histogram.

No posterior in a free run.

# Matlab Hands-On: run\_lorenz\_96

- 1) Stop the free run after some time.
- 2) Turn on the EAKF.
- 3) Advance model, assimilate...

Note: All 40 state variables are observed. Observation error standard deviation is 4.0

Your figures will be different depending on your settings.  
That's OK.

# Matlab Hands-On: run\_lorenz\_96

## Explorations:

- Do an extended free run to see error growth in the ensemble.  
How long does it take to saturate?
- Select EAKF and explore how the assimilation works.
